	1890	6	152	159,000

FORESTS AND FOREST PRODUCTS. The total wooded area in 1900 was 35,300 square miles, or 73 per cent. of the State's area. Over a portion of this the best timber, particularly the oak and poplar, has been removed. Extensive areas of yellow pine have been cut, and the bulk of the lumber product consists of this variety. The cypress forests have contributed but little to the lumber supply. In 1901 an examination in the mountain regions was made, and the report estimated the stand of timber at 10,650,000,000 feet, of which 41.41 per cent. was oak, 17.20 chestnut, and 5.30 hemlock. The value of the lumber prod-

uct increased from less than \$1,000,000 in 1850 to \$5,898,742 in 1890, and \$14,862,593 in 1900. The dependent industries—the manufactures of planing-mill products, etc.—made large gains in the decade 1890-1900, as is shown in the above table. The turpentine and resin product was valued at over \$1,000,000 in 1900.

TRANSPORTATION AND COMMERCE. The Raleigh and Gaston Railroad Company was the first to begin construction, in 1836. This and the Wilmington and Weldon Railroad were completed in 1840. The most active decade in railroad construction was 1880-90, when the mileage increased from 1846 to 3128 miles. In 1900 there were 3732 miles in operation. The major part of the mileage belongs to the three principal systems, namely: The Seaboard Air Line (614 miles), the Atlantic Coast Line (949 miles), and the Southern (1226 miles). A number of the rivers are navigable through the coast plain region, and together with the coast waters are of considerable importance in the local commerce. There are two customs districts—Wilmington and Pamlico. The former ranks eighth among the Atlantic districts in the value of its foreign trade, the greater part of which consists of exports.

BANKS. There were no banks in North Carolina until 1804, when two were chartered. The State subscribed for shares in both. The State Bank of North Carolina was organized in 1810

in Raleigh, with branches in six towns. In this bank also the State was heavily interested, as its notes were the main currency in the Commonwealth. There were 31 banks in 1861, but the

	National banks	State banks	Private banks	Savings banks
Number.....	38	81	21	14
Capital.....	\$3,280,000	\$2,858,000	\$205,000	
Surplus.....	1,073,000	561,000	95,000	\$28,000
Cash, etc.....	961,000	1,029,000	77,000	85,000

Loans.....	11,437,000	10,020,000	902,000	2,399,000

vicissitudes of the next four years destroyed their financial standing. In 1866 an act was passed enabling them to close their business. A revival of banking came only during 1890-1900.

The condition of the banks in 1902 is shown on the preceding page.

GOVERNMENT. The present Constitution was adopted in 1868. An amendment requires a three-fifths vote of each House, and approval by a majority of the popular vote. A proposal to call a constitutional convention must receive a two-thirds vote of each House and a majority of the popular vote.

Voters must have resided in the State two years, in the county six months, in an election district four months. Persons who were not entitled to vote in any State prior to 1867, or are not descendants of persons entitled to vote prior to that time, must be able to read and write any section of the Constitution in the English language. Privileged illiterates must register before December 1, 1908. Suffrage is further conditioned upon the payment of poll tax.

LEGISLATURE. The Legislature consists of 50 Senators, representing districts of undivided contiguous counties, and 120 Representatives, at least one for every county. All members are elected for two years and receive \$4 a day and mileage. They meet biennially on the Wednesday after the first Monday in January, and the session is limited to sixty days. State elections are held biennially on the Tuesday after the first Monday in November. The power of impeachment rests with the House, the trial of impeachment with the Senate.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary of State, Auditor, Treasurer, Superintendent of Public Instruction, and Attorney-General are elected for four years. The Governor has the usual power to convene extra sessions of the Legislature and grant pardons. The Secretary of State, Auditor, Treasurer, and Superintendent of Public Instruction constitute a Council of State to advise with the Governor.

JUDICIARY. The Supreme Court consists of a Chief Justice and four associates. The State is divided into judicial districts, a judge being chosen in each district. A Superior Court must be held in each county at least twice each year. The Legislature provides special courts for cities and towns. Each county elects a clerk of the Superior Court every four years. A solicitor serving four years is elected in each judicial district.

LOCAL. Each county elects a sheriff, coroner, treasurer, register of deeds, surveyor, and five commissioners, who hold office for two years. The commissioners have charge of the penal and charitable institutions, schools, roads, bridges, and finances. Each township elects biennially a clerk and two justices of the peace, who constitute a board of trustees. They act under the supervision of the county commissioners. The townships also elect for a similar period a constable and a school committee of three persons. These provisions, however, may be changed by statute.

MISCELLANEOUS. Atheists are disqualified for office, and also all persons who have been convicted of treason, perjury, or other infamous crimes, and not legally restored to the rights of citizenship. The property of a married woman is her own, and not liable for the debts of her

husband. Personal property is exempt for debt to the value of \$500. There are also provisions for liberal homestead exemptions. A local-option liquor law was passed in 1887. The legal rate of interest is 6 per cent.; 8 is allowed by contract. The State has ten members in the Lower House of the National Congress. The capital of the State is Raleigh.

FINANCES. North Carolina had no debt until the advent of the epoch of railroad building. In 1848-58 several issues of bonds were authorized in aid of railroad, plank road, and canal companies, and as security the State received stock in these companies. At the beginning of the Civil War the debt of the State amounted to \$18,167,000. The financial troubles of the war greatly aggravated this condition, but the enormous loans for war purposes were repudiated by order of President Johnson in 1865. Great injury to the finances of North Carolina was done during the five years of the 'carpetbag' régime that followed. Large issues of bonds for purposes of railroad construction followed one another in rapid succession. The Constitution of 1868 forbids the issue of any bonds unless a special tax for payment of interest be levied. But this did not stop the growth of the debt, for in the following two years more than \$16,000,000 of the 'special tax bonds' were issued. Another cause for issuing bonds was the refunding of old obligations and their unpaid coupons. Altogether, in 1865-70, \$24,375,800 of bonds were issued, and the total debt exceeded \$42,000,000. As against this the State held \$22,000,000 of railroad stocks, out of which only \$3,000,000 paid dividend. The rest were worthless, as the money obtained from sale of the State bonds was squandered. The burden of the interest on these bonds lay very heavily upon the State, and there was constant defaulting.

This condition of affairs caused great popular dissatisfaction and a tendency toward repudiation. Payment of interest on the 'special tax' loans was stopped in 1870, the special tax laws were repealed, and all the efforts of the bondholders to enforce payment through courts remained futile. In 1879 a compromise was reached with regard to the rest of the State debt. Under this compromise the old bonds were refunded at the rate of 15 per cent. to 40 per cent., according to issues. The conversion proceeded from 1880 to 1900, and the debt remained almost the same. The compromise has improved the finances considerably. The budget of the State is small, but instead of the large deficits there is a small surplus. On November 30, 1902, the State debt was \$6,527,770. The total receipts for the year were \$1,924,134; expenditures, \$1,866,640; the balance in the treasury, \$111,280. The main sources of income are a general property tax (about 40 per cent.), North Carolina Railroad dividends (10 per cent.), railroad and corporation taxes, earnings of the State prison, etc. Of the disbursements almost \$300,000 a year goes for payment of interest.

MILITIA. The State had 326,202 men of militia age in 1900. The militia numbered 1860 in 1901.

POPULATION. The following figures show the growth of the population: 1790, 393,751; 1820, 638,829; 1850, 869,039; 1860, 992,622; 1870, 1,071,361; 1880, 1,399,750; 1890, 1,617,947; 1900,

1,893,810. From third rank in 1790 the State fell to tenth in 1850, and fifteenth in 1900. The per cent. of gain for 1890-1900 was 17.1, as compared with 20.7 for the United States. The State's heavy contribution to the westward tide of immigration reached its climax in the decade 1830-40, which accounts for the stationary position of the population for that decade. North Carolina has the smallest foreign-born population—4492—of any State. In 1900 there were 624,469 negroes, the State holding seventh rank in negro population. The increase in this element from 1890 to 1900 was 101,451. The negroes are much less numerous in the western or mountainous counties. As is true of most of the Southern Commonwealths, the urban population constitutes but a small percentage of the total. In 1900 17 places had over 4000 inhabitants each, and together contained 8 per cent. of the total population.

CITIES. The population of the four largest towns in 1900 was: Wilmington, 20,976; Charlotte, 18,091; Asheville, 14,694; and Raleigh, 13,643.

RELIGION. The leading religious denominations are the Baptist and the Methodist, comprising respectively about one-half and two-fifths of all church members. The Presbyterians, Lutherans, Disciples of Christ, Episcopalians, Congregationalists, and Roman Catholics are largely represented.

EDUCATION. Education in the State of North Carolina received a considerable impetus from the immigration of the Scotch-Irish during the second half of the eighteenth century. Classical schools were maintained by many of the Presbyterian missionaries, and as these were mostly graduates of Princeton University, that institution had a considerable influence on higher education in the State. Moravians and Germans also played a conspicuous part in this development. The first State Constitution contained a clause providing for public education, but nothing was done toward carrying it out before 1825, when the dividends from stocks held by the State in several banks and navigation companies, and the revenue derived from liquor licenses, etc., as well as the vacant and unappropriated swamp lands of the State, were appropriated for a common school fund. This fund was subsequently augmented by \$1,133,757—the State's share of the surplus revenue distributed among the States by the act of Congress of 1836. The public school system was established in 1840, and the first State Superintendent of Public Instruction was appointed in 1852. By 1860 North Carolina was in education the most advanced of the slaveholding States.

Only a comparatively small part of the school-age population is provided with schools. North Carolina has neither a compulsory attendance law nor uniform requirements for teachers, the professional standing of whom, especially in the colored schools, is in many cases very low. According to the census of 1900, the illiterate population of North Carolina amounted to 28.7 per cent. of the total population of ten years of age and over, being 19.5 per cent. for the native whites and 47.6 per cent. for the colored. The illiteracy of the native whites shows a decrease of 3.6 per cent. for the decade of 1890-1900, as compared with the decrease of 12.5 per cent. for the colored during the same period.

In 1900 North Carolina had a school population (6 to 21) of 439,431 white and 220,198 colored. The enrollment for the same year was 270,447 white and 130,005 colored; and about one-half each of the colored and white enrollment was in average attendance.

The length of the school term in 1900 was 73 days for the white and 65 days for the colored, or an average of 70.5 days, the lowest of any State. Of the 7387 teachers employed in 1900, the men constituted 49.4 per cent. The average monthly salaries of white teachers in 1900 were \$26.18 for male teachers and \$23.41 for female; the average salaries of the colored male and female teachers were \$21.14 and \$19.82, respectively, as compared with \$24.69 and \$20.36, respectively, in 1884. The total revenue for the public schools for 1900 amounted to \$1,031,327, and the expenditure to \$950,317, or about \$4.60 per pupil in average attendance. The school revenue is derived principally from a general property tax, a general poll tax, liquor licenses, fines, forfeitures, and penalties.

Secondary education is provided chiefly by the private high schools and academies. There are seven normal schools for the colored youth, and a State normal and industrial college for white women. The chief institutions for higher education are the University of North Carolina, at Chapel Hill; the College of Agriculture and Mechanic Arts, and Davidson College (Presb.), at Davidson; Trinity College (M. E.), at Durham; Wake Forest College (Bapt.), at Wake Forest; Elon College (Christian), at Elon College; Guilford College (Friends), at Guilford; and Saint Mary's College (R. C.), at Belmont. Higher education for the colored race is provided by the Agricultural and Mechanical College (State), at Greensboro; Shaw University (Bapt.), at Raleigh; Biddle University (Presb.), at Charlotte; and Livingstone College (A. M. E. Zion), at Salisbury.

CHARITABLE AND PENAL INSTITUTIONS. There is an unsalaried Board of Public Charities which has supervision of the State charitable and penal institutions, and of the county and municipal jails, workhouses, and 'homes.' County 'homes' are inspected by county boards of visitors. The State maintains an insane asylum for the whites at Raleigh and one at Morganton; also an asylum at Goldsboro for colored insane—the first in the world for this class. There are a State institute for the blind at Raleigh, a school for the deaf at Morganton, and another for the colored deaf, dumb, and blind at Raleigh. A Confederate soldiers' home is located at Raleigh, and an orphan asylum for whites and for blacks at Oxford. The State penitentiary is located at Raleigh. Only those sentenced for the highest crimes are confined in the penitentiary proper. About nine-tenths of the convicts are employed on State farms. The convicts are controlled by State officers and not under the lease system.

HISTORY. On July 4, 1584, Philip Amadas and Arthur Barlow, sent by Sir Walter Raleigh under a charter granted by Queen Elizabeth to make explorations in America, dropped anchor off the present coast of North Carolina. On their return they gave the most flattering accounts of the country. The next year a colony of men was sent out under Ralph Lane to make a permanent settlement. They made no attempt to provide a food supply, and in 1586 abandoned the settle-

ment which they had founded on Roanoke Island. The next year John White was sent with men, women, and children. He went back to England for supplies, but on his return the colony had utterly vanished; tradition relates that they were absorbed by an Indian tribe in the neighborhood. In 1629 Charles I. granted to Sir Robert Heath, under the name of Carolina, the territory between 31° and 36° N., but the proprietor failed to make use of his grant, and in 1663 Charles II. conferred on eight 'Lords Proprietors' the territory between 31° and 36° extending to the Pacific Ocean. The limits were enlarged in 1665 to 29° to 36° 30'. The proprietors received palatine powers, divided the territory into two parts, North and South Carolina, and began to send out settlers. Already there were scattered settlements along the streams and sounds in the eastern part. For the government of the colony, an elaborate scheme, the 'Fundamental Constitution' was drawn up by the philosopher John Locke. This provided for three orders of nobility and four houses of Parliament. It was never put fully into operation, and was abandoned entirely in 1693. The population was hardy and rude and paid little attention to any sort of government, occasionally driving away an obnoxious Governor by force. Up to 1710, when Edward Hyde was appointed Governor of North Carolina, there was but one Governor for Carolina with deputies for the divisions. A strong hand was, however, needed. In 1711 the Tuscarora Indians had fallen upon the scattered farms and massacred several hundred people, and the power of the Indians was broken only by aid from Virginia and South Carolina. (See MOORE, JAMES.) Pirates also were ravaging the coast.

Carolina did not prove a success from a financial standpoint, and in 1728 seven of the proprietors sold to the Crown their shares for £2500 each. Lord Carteret (afterwards Lord Granville) retained his, and in 1744 it was laid off in severalty for him. Affairs were more settled after the Crown assumed control, and the western portion of North Carolina began to receive settlers, largely Scotch-Irish from Pennsylvania, and Germans from the Palatinate. After the battle of Culloden (1746) a number of Scotch settled on the Upper Cape Fear River. Many of the royal Governors came into conflict with the inhabitants, and during the administration of William Tryon the Regulators (q.v.) threatened to overturn the Government in 1771.

The First Provincial Congress met in defiance of Governor Josiah Martin (q.v.) in 1774, and sent delegates to the Continental Congress. (See MECKLENBURG DECLARATION OF INDEPENDENCE.) The colony was the first to authorize her delegates in Congress to vote for independence, on April 12, 1776, and a State constitution was adopted, on December 18, 1776. North Carolina troops took part in many of the important battles of the war, and in 1780-81 the State was invaded by the British. The State sent delegates to the national constitutional convention in 1787, but refused to ratify the instrument, in 1788, and presented twenty-six amendments. The State did not vote in the first Presidential election, but after the adoption of the first ten amendments to the Constitution, ratified that instrument, on November 19, 1789. The western lands, now the State of Tennessee, were offered to Congress in 1784. The inhabitants, indignant at

being transferred without their consent, revolted and set up the State of Franklin. Governor Caswell was able to cause the dissolution of this abortive State, and the lands were again ceded in 1790. The next year the capital was located at Raleigh. In 1795 the State University was opened for students. The question of a market for their products was a serious one to the residents of the middle and eastern counties. After 1820 much money was spent in the fruitless attempt to make the shallow rivers navigable, and to connect them by canals. The measures were opposed by the eastern counties, which had abundant water transportation. The question of constitutional revision was one of great interest for a long time. The Constitution of 1776 gave equal representation to every county, and this gave an unfair advantage to the smaller counties of the east. After much effort the Convention of 1835 was called and drafted a constitution giving representation in the Senate according to property and in the House according to population. But during this period thousands of people had gone to Ohio, Indiana, and Illinois.

The State opposed secession as a matter of expediency, and in February, 1861, refused to call a convention, but with President Lincoln's demand for troops to coerce the seceding States sentiment changed. An ordinance of secession was unanimously passed, May 20th, and the State lost the first soldier of the war at Big Bethel. North Carolina furnished more than 120,000 soldiers to the Confederate cause, nearly twice her proportion, lost more soldiers than any other Southern State, and during the last year of the war practically fed Lee's army. At the close of the war W. W. Holden, formerly a rabid secessionist, was appointed Provisional Governor. A convention was called which repealed the ordinance of secession, abolished slavery, and ordered an election for State officers. Jonathan Worth was elected Governor, but in the following year the new Constitution was rejected. With the beginning of reconstruction in 1867 the civil authority was superseded by the military. Another convention was called in 1868, and a constitution allowing negro suffrage was adopted. Under this W. W. Holden was elected Governor. In this year the Ku-Klux-Klan (q.v.) appeared, and Alamance and Granville counties were placed under martial law. The Conservative Democrats secured the Legislature in 1870, and Governor Holden was impeached. The present Constitution was adopted in 1876, and in 1900 a clause intended to restrict negro suffrage was added. The State has been Democratic in national elections since the beginning of parties, with the exception of the years 1840-48, when it voted for the Whig candidates, and 1868-72, when its vote was cast for Grant. The Governors of the colony and State have been as follows:

UNDER THE LORDS PROPRIETORS

William Drummond.....	1663-67
Samuel Stephens.....	1667-70
Peter Carteret.....	1670
Samuel Stephens.....	1670-74

NORTH CAROLINA, UNIVERSITY OF. A State institution at Chapel Hill, N. C., chartered in 1789, and opened in 1795. It comprises a college and schools of law, medicine, and pharmacy, together with a summer school for teachers. It confers the bachelor's degree in arts, science, philosophy, and law, the degree of graduate in pharmacy, the master's degree in arts and science, and the doctor's degree in philosophy and medicine. Free instruction is offered to graduates of colleges and universities, to candidates for the ministry, to teachers and young men who are preparing to teach, and to those who are laboring under bodily infirmities. A loan fund, established by Rev. C. F. Deems of New York, and enlarged by Mr. W. H. Vanderbilt, furnishes temporary assistance to indigent students. Women are admitted to the higher courses. In 1903 the university had an attendance of 698, a faculty of 66, and a library of 41,000 volumes. The campus covers 48 acres, and with the buildings, fifteen in number, is valued at \$500,000.

NORTH CONWAY. A village of New Hampshire. See CONWAY.

NORTHCOTE, north'köt, JAMES (1746-1831). An English historical and portrait painter and author, born at Plymouth. The son of a poor watchmaker, who insisted upon apprenticing James to his trade, he was hampered in his early artistic aspirations, but in 1771 managed to make his way to London, where Sir Joshua Reynolds admitted him into his studio as an assistant, and soon after invited him to live in his house. Northcote studied also at the Royal Academy, exhibited there some good portraits, and, after remaining with Reynolds five years, returned home and thence went to Italy in 1777. For two years in Rome he studied the great masters, especially Titian, then visited Florence, where he was requested to paint his own portrait for the Uffizi Gallery, and was elected a member of the Academy. Back in London in 1780, he became a regular exhibitor, first of portraits, and from 1783 on of subject pictures. The success of one of these led to his being employed by Boydell, the publisher, to paint nine pictures for the famous Shakespeare Gallery, the most celebrated of which are "The Murder of the Princes in the Tower," "The Burial of the Princes," "Prince Arthur and Hubert," and "Entry of Bolingbroke and Richard II. into London." Their popularity brought him the commission for a large painting of the "Death of Wat Tyler in 1381" (1786), now in the Guildhall, London. Of his other numerous historical subjects, the only one in a public collection is the "Presentation of British Officers to Pope Pius VI.," in the South Kensington Museum. He also obtained considerable success with pictures of animals, but his fame is due chiefly to his portraits. The National Gallery contains those of Dr. Jenner, of Viscount Exmouth, and one of himself (1827). His literary ability is proved by his *Memoirs of Sir Joshua*

Reynolds (1813), to which a supplement was added in 1815, and by *One Hundred Fables* (1828), illustrated with numerous wood cuts after his own designs. In 1830 he published a *Life of Titian*, and after his death appeared a second series of fables under the title *The Artists' Book of Fables*. Consult: Cunningham, *Lives of the Most Eminent British Painters*, edited by Heaton (London, 1879).

NORTHCOTE, Sir STAFFORD HENRY, first Earl of Iddesleigh (1818-1887). An English statesman and financier, born in London. He was educated at Eton and Oxford, graduating at Balliol College in 1839 with high honors. His first position in political life was that of private secretary to Gladstone, when the latter was president of the Board of Trade. In 1847 he was called to the bar and was made legal secretary to the Board of Trade. In 1851 he succeeded to the family title and estates as eighth baronet of his line. He was member of Parliament for Dudley and Stamford 1855-66, and was then returned for North Devon, which place he continued to represent in the interest of the Conservative Party. He was president of the Board of Trade in 1866-67, and in 1867 was made Secretary of State for India. From 1869 to 1874 he was chairman of the Hudson's Bay Company, and promoted the transfer of Prince Rupert's Land to the Canadian Government. He visited Canada and the United States in 1870 to study conditions, and was a member of the joint high commission which signed the Treaty of Washington on May 8, 1871. On the formation of Disraeli's Cabinet in 1874, Sir Stafford Northcote was made Chancellor of the Exchequer, and when his leader was elevated to the peerage under the title of Lord Beaconsfield, Northcote became leader of the Commons. In the first Salisbury Administration (1885-86) he was First Lord of the Treasury. He was created Earl of Iddesleigh and Viscount Saint Cyres in 1885. When Salisbury became Premier for the second time (1886) the Earl of Iddesleigh was made Foreign Secretary. He died suddenly on January 12, 1887, in the presence of Lord Salisbury, the Premier, in the official residence, London. Northcote published a number of political and financial pamphlets, such as *Twenty Years of Financial Policy* (London, 1862). His character was distinguished by unselfishness, pure-mindedness, and sincere patriotism. Consult his collected *Lectures and Essays* (London, 1887); Lang, *Life, Letters, and Diaries of Stafford Northcote, First Earl of Iddesleigh* (London, 1890).

NORTH DAKOTA. A north central State of the United States, lying between latitudes 45° 55' and 49° N., and between longitudes 96° 25' and 104° 3' W. It is bounded on the north by the Canadian provinces of Assiniboia and Manitoba, on the east by Minnesota, on the south by South Dakota, and on the west by Montana. Its boundaries are straight lines, except the eastern border, which is formed by the Red River of the North. Its shape is that of a rectangle, with an extreme length east and west of 360 miles, and a breadth of 210 miles. The area is 70,795 square miles, of which 70,195 cover the land surface. North Dakota ranks fourteenth in size among the States.

TOPOGRAPHY. The eastern part of the State is the perfectly level bed of the ancient Lake

Agassiz, now traversed by the Red River and its tributaries. It lies about 1000 feet above sea-level, and merges westward into the rolling prairies of the central region. In the north the land rises to a height of over 2000 feet in the small forest-covered plateau known as the Turtle Mountains. This range extends about 20 miles south of the Manitoba boundary. Southwestward the prairies rise toward the grassy Plateau du Coteau du Missouri, which has an elevation of 2000 feet near the centre of the State, and rises gradually to 3000 feet in the extreme southwestern corner. There are no great altitudes above the general level. In the central region there are rounded, grassy, and boulder-crowned hills of glacial drift; and in the southwest isolated conical buttes capped with sandstone become more and more frequent until the rough and rocky 'bad lands' of the southwestern corner are reached.

The principal rivers lie from 100 to 300 feet below the surrounding plains, and are lined with bluffs. The western half of the State is traversed in a winding southeast course by the Missouri River, which enters on the western boundary and leaves the State near the middle of the southern boundary. Its chief tributaries from the State are from the right and drain the southwestern plateau. They are the Little Missouri, Knife, Heart, and Cannon Ball rivers. The Yellowstone also joins the Missouri in North Dakota immediately east of the Montana boundary line. The northern portion is drained by the Souris or Mouse River, which flows southeast from Canada and re-enters that country in the opposite direction after making a long narrow loop toward the centre of the State. From this central section the James River flows southward into South Dakota, where it joins the Missouri. The remaining eastern portion is drained by the Red River of the North, chief of whose numerous tributaries is the Sheyenne. Scattered over the central and eastern plains are numerous lakes, the largest of which is Devil's Lake, an irregular body of water 32 miles long and 1 to 5 miles wide, with wooded shores.

CLIMATE, SOIL, AND VEGETATION. North Dakota has a typical continental climate characterized by enormous extremes of temperature, which, however, the dry atmosphere renders bearable, healthful, and invigorating. The mean temperature for January is 3°, and for July 70°. The extremes have a range of nearly 155° for the year, a maximum having been recorded as high as 114°, while a minimum of 40° below zero is not rare. The average annual rainfall of 17.29 inches would scarcely suffice for the needs of agriculture were it not for the fact that fully three-fourths of the precipitation falls during the growing season (April to September). In the western half of the State, however, the rainfall is insufficient for successful agriculture. The deep alluvial deposits of the Red River Valley are of inexhaustible fertility, and are conspicuously favorable to wheat-growing. The glacial drift of the prairies forms, in addition, an excellent subsoil, but toward the west it grows poorer and more scanty, especially in the southwest. Forest growth is found only along the river banks, and on the Turtle Mountains in the north, and in some sections of the Red River Valley. The remainder of the State is a treeless prairie covered with numerous species of

grasses and other forage plants. The principal trees are cottonwood along the rivers, and oak, elm, birch, ash, and poplar in the Turtle Mountains.

GEOLOGY AND MINERAL RESOURCES. The rock formations of the State include the Archæan, Cambrian, Silurian, Cretaceous, and Tertiary systems. The Dakota sandstone of the Cretaceous system is an important member, being the chief water-bearing stratum on which the artesian wells of North Dakota depend. Most of the rocks, however, are covered by a deposit of glacial drift, composed of sand, gravel, and clay. In the Red River Valley there is a thick layer of alluvium deposited by Lake Agassiz, whose ancient shore-lines have been traced all around the valley. The central and western portions of the State are underlaid with extensive beds of lignite, which is being more and more utilized. The production in 1901 amounted to 166,601 tons, valued at \$214,151. Clay is the only other mineral utilized to any considerable extent, though some building-stone is available, and lime, salt, and a little iron are found.

AGRICULTURE. Although stock-raising made considerable progress in the decade 1870-80, the putting of the land under plow was almost wholly the work of the succeeding decades. The number of acres included in farms doubled from 1890 to 1900, and amounted in the latter year to 34.6 per cent. of the total area. Of the farm area, 62.1 per cent. was improved. During the same decade the average size of farms increased from 277.4 acres to 342.9 acres—a larger average than is found in any other State. In 1900, 1346 farms contained over 1000 acres each. Excepting that of the 'bad lands,' in the southwest, the soil is not only unusually fertile, but also easily tilled. Its composition is fortunately such as to favor the retention of moisture. Nevertheless, there are occasionally severe droughts.

Everywhere wheat is the dominant crop. In 1899 it constituted 56 per cent. of the total crop area. In the same year the per capita acreage of wheat, 13.9 acres, was larger than in any other State. The Red River Valley, which extends entirely across the eastern end of North Dakota, is perhaps the most famous wheat-producing region in the world. In the six counties bordering the Red River almost half of the total area is devoted to wheat. Oats is the next most important cereal. The cultivation of flax increased during the decade 1890-1900 from a few thousand acres to an acreage exceeding that of any other State. Barley is most extensively produced in the northeastern counties and corn in the southeastern. Potatoes yield abundantly and are an important crop. But very little fruit is raised.

The following table gives the acreage of the leading crops for the census years indicated:

CROPS	1900	1890
Wheat.....	4,451,251	2,709,421
Oats.....	780,517	402,855
Flax.....	773,999	43,724
Barley.....	287,092	109,400
Corn.....	42,373	11,954
Rye.....	27,995	1,568
Hay.....	1,410,534	558,720
Potatoes.....	21,936	18,262

STOCK-RAISING. The prairie lands afford excellent pasturage, and large areas of wild salt and prairie grasses are annually cut for winter feed. With the exception of mules, all kinds

of domestic animals showed large gains from 1890 to 1900. Cattle and horses are the most important varieties.

The following table, taken from the census, shows the relative prominence of the principal varieties of farm animals:

	1900	1890
Dairy cows.....	125,503	88,299
Neat cattle.....	531,931	193,565
Horses.....	359,948	130,931
Mules and asses.....	6,976	8,709
Sheep.....	451,437	136,413
Swine.....	191,798	92,213

MANUFACTURES. But little manufacturing is carried on besides the so-called neighborhood industries. In 1900 the wage-earners numbered 2398, and the total value of the product was \$9,183,114, of which \$4,134,023 represented the flour and grist-mill output.

TRANSPORTATION. In 1870 the combined mileage of the railways in what is now North and South Dakota was only 65 miles. In 1890 North Dakota alone had 2116 miles, which figure had increased in 1900 to 2810. The eastern part of the State is well supplied with railroad facilities. The Great Northern crosses the northern part, and the Northern Pacific the southern part. In addition, the Saint Paul, Minneapolis and Sault Ste. Marie enters the State at the southwest corner and extends in a northwest direction entirely across the Commonwealth. These three lines with their branches constitute the greater part of the total mileage. All three have connections with the Canadian system of railroads, the two former by way of the Red River Valley. There is a railroad commission empowered to alter tariffs, to make rules and regulations, and to hear and decide complaints subject to the revision of the courts. The Red River is navigable part of the year, but is not extensively used.

BANKING. Until the organization of the State there was very little banking within its confines. In 1873 the first private bank commenced operations. The first incorporated bank opened in 1878 as a national bank. At the time of admission to Statehood there were 30 national and 8 State banks. One of the first measures of the Legislature in 1890 was to pass a stringent banking law prohibiting private banking; creating the office of Superintendent of Banks; and providing for reports and examinations. Under the security of this law many State banks were organized, and the number of national banks diminished somewhat. In 1892-93 the reputation of the North Dakota banks was seriously injured by the long list of failures of the so-called 'Mears Banks,' organized by E. Mears according to the Territorial law, and therefore not amenable to the new regulations. The last of these banks went into liquidation in 1896, and the reputation of the banks of the State was restored. The condition of the banks in 1902 is shown in the following table:

	National banks	State banks
Number.....	49	163
Capital.....	\$2,076,000	\$1,782,000
Surplus.....	329,000	223,000
Cash, etc.....	794,000	917,000
Deposits.....	9,772,000	9,326,000*
Loans.....	9,218,000	5,840,000

GOVERNMENT. The State Constitution was adopted in October, 1889. A proposed amendment must receive the approval of a majority of the members elected to two successive legislative assemblies, and of a majority of the qualified electors at a popular election. Voters must be either citizens, or civilized Indians who have severed their tribal relations two years before election. Voters must also have resided in the State one year, in the county six months, and in the precinct ninety days. The Legislature may prescribe penalties for failing, neglecting, or refusing to vote at any general election. The capital of the State is Bismarck.

LEGISLATIVE. The Senate must consist of not less than 30 or more than 50 members; the House of Representatives of not less than 60 or more than 140 members. The Senators are elected from districts of contiguous undivided counties for a term of 4 years. The Representatives are elected at large from the Senatorial districts for a term of 2 years. Both receive \$5 per day and mileage. Sessions are biennial, beginning on the first Tuesday after the first Monday in January, and are limited to 60 days.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary of State, Auditor, Treasurer, Superintendent of Public Instruction, Commissioner of Insurance, three Commissioners of Railroads, an Attorney-General, and a Commissioner of Agriculture and Labor are elected every two years. The Governor can veto all bills or any item of any appropriation bill, but his veto is overridden by a two-thirds vote of both Houses. An unreturned bill becomes a law after three days. The Governor may call extra sessions, and, in conjunction with a board of pardons, may exercise the pardoning power.

JUDICIARY. There is a Supreme Court of three judges elected by the State at large for the period of 6 years. There are 6 district courts, a judge being elected in each district for 4 years. The Legislature can increase the number. A clerk of the district court is elected in each county for 4 years. County court judges are elected for 2 years. The Legislature provides by law for the election of justices of the peace and police magistrates.

LOCAL GOVERNMENT. General laws provide for organizing new counties and changing county lines. There must be, however, at least 24 Congressional townships and 1000 inhabitants in each county. Changes in boundaries must be approved by popular vote of the counties affected. Township organization is also provided for by a general law. Every two years the counties elect a register of deeds, auditor, treasurer, sheriff, and attorney. Other county, township, and district officers may be provided for by law.

OTHER LEGAL PROVISIONS. Trusts or combinations controlling the price or cost of exchange of articles are unlawful. The importation, manufacture, sale, or gift of intoxicating liquors is prohibited. The legal rate of interest is 7 per cent., though 12 may be allowed by contract. Judgments outlaw in 10 years, notes in 6 years.

FINANCES. The small public debt was created mainly in 1884-89, before admission to Statehood, for purposes of construction of public buildings. It bore 6 per cent., but was refunded after 1890 in 4 per cent. bonds. At the time of admission the debt was \$689,000, and the Con-

stitution prohibits any increase of this debt by more than \$200,000. The income of the State is derived from a general property tax limited by the Constitution to 4 mills, from a tax on corporations and railroads, and from sale of public lands. All the proceeds from the last source must go into the permanent school fund.

On June 30, 1902, the State had a balance on hand in the treasury of \$562,582.81. The total receipts from June 30, 1900, to June 30, 1902, were \$3,126,435.08, and the expenditures for the same period amounted to \$2,740,278.27. The bonded indebtedness on June 30, 1902, was \$722,300.

MILITIA. The number of men of militia age in 1900 was 80,191. The militia in 1901 numbered 718.

POPULATION. The population of North Dakota by decades is as follows: 1870, 2405; 1880, 36,909; 1890, 182,719; 1900, 319,146. North Dakota at the first two censuses was a part of the Territory of Dakota. The increase in the last decade amounted to 74.7 per cent. The counties along the Red River are the most densely populated. But few people are located in the western half of the State. There is a larger per cent. of foreign-born than is found in any other State. In 1900 this element of the population numbered 113,091, and there was a still larger number of native whites of foreign parents, these two elements almost equaling four-fifths of the total population. The Canadians and Swedes are the chief foreign nationalities represented. Only two towns had more than 4000 inhabitants in 1900: Fargo, 9589; and Grand Forks, 7652. The State sends two members to the National House of Representatives.

RELIGION. The principal Protestant denomination is the Lutheran. It represents about one-third of all the church members. The Roman Catholics form over one-seventh of the total population. The other denominations, in order of importance, are Methodist, Presbyterian, Baptist, and the Congregational.

EDUCATION. The Constitution provides for a free public school system under the supervision of a board of commissioners consisting of the Governor, the State Superintendent of Public Instruction, and the president of the State University. The system of high schools is under the control of local boards of education, city superintendents, and State high school boards; and there are a State normal school and institutions for higher education. The proportion of illiteracy in 1900 was 5.6 per cent., being the highest (with the exception of Missouri) in the North Central division of States. This proportion ranges from 0.9 per cent. for the native white population, to 6.7 per cent. for the foreign white, and to 59.2 per cent. for the colored. The 2641 common schools (245 graded) had in 1900 an enrollment of 77,686, and an average daily attendance of 43,560. The length of the school term in 1900 was 155.7 days, as against 113 days in 1890. The average monthly salaries of male and female teachers in 1900 were \$41.72 and \$36.80 respectively.

The total income for school purposes in 1900 was \$1,456,496, the revenue being derived principally from local taxes, from the permanent school fund, and from the sale and rental of school lands. The expenditure per pupil, based on average attendance, was \$35.03—the highest ex-

penditure found among the North Central States and a figure exceeded in but few States. Under the enabling act admitting the State of North Dakota to the Union, the 16th and 36th sections of every township were granted for the maintenance of the common schools. The State thus acquired about 2,300,000 acres. In 1900 North Dakota had 27 public high schools with a total attendance of 1130. Normal education is provided by two public schools (at Mayville and Valley City) and one private normal school. The institutions for higher education are the University of North Dakota, at Grand Forks; Fargo College (Cong.), at Fargo; Red River Valley University (M. E.), at Wahpeton; and the Agricultural College, at Fargo.

CHARITABLE AND PENAL INSTITUTIONS. The State maintains a school for the deaf at Devil's Lake, an asylum for the insane at Jamestown, a school for the feeble-minded at Grafton, and a soldiers' home at Lisbon. The State penitentiary is located at Bismarck.

HISTORY. The whole territory of Dakota was a part of the Louisiana Purchase, and was for a long time unorganized. Lewis and Clark in their expedition of 1804-06 spent the first winter near Mandan. British subjects had posts for the fur trade within the territory, and Lord Selkirk, considering it British territory, built a fort near Pembina in 1810. Previously, about 1780, French Canadians had settled at this place. Frémont in 1839 explored much of the country, and Lieutenant Warner in 1855 made a report on the region for the Government. The Sioux Indians in 1851 ceded a portion of their lands to the Government and they were opened for settlement. The part east of the Missouri River was first attached to the Territory of Minnesota in 1849. The part west, together with much of Idaho, Wyoming, and Montana, became part of Nebraska Territory in 1854. On March 2, 1861, the Territory of Dakota was organized.

The Indians were hostile and population was sparse until after 1866. With the growth of population came agitation for Statehood, and the Territory was divided into two (see **SOUTH DAKOTA**), and on February 22, 1889, Congress authorized the calling of conventions to form constitutions. The convention for North Dakota met at Bismarck July 4, and formed a constitution. It was ratified in October, together with a prohibition article which was submitted separately. On November 2d President Harrison declared the State admitted. Politically the State has been Republican from its admission, with the exception of one election (1892), when a fusion of the Farmers' Alliance with the Democrats gave them control.

NORTH DAKOTA, UNIVERSITY OF. A co-educational State institution at Grand Forks,

N. D., established in 1883. By the enabling act of Congress under which the State was admitted, the university received a grant of 86,080 acres of land, and the School of Mines, a grant of 40,000 acres. The university comprises a college of arts, a normal college, and departments of law, mining engineering, mechanical and electrical engineering, military science, and pharmacy, together with a preparatory department. In 1902 it had 500 students, 35 instructors, and a library containing 10,000 volumes. The college property was valued at \$2,500,000, including a campus of 80 acres, valued with the college buildings at \$350,000, and the income was \$80,000. University extension work is carried on by means of lectures given in different parts of the State.

NORTH DOWNS. A ridge of hills in England. See under **DOWNS**.

NORTHEAST BOUNDARY DISPUTE.

In American history, the name applied to the long-standing dispute between the United States and Great Britain concerning the northeastern boundary of the United States. The controversy grew out of a difference in interpretation of the second article of the Treaty of Paris of 1783, which undertook to define the boundaries between the United States and Canada. In this article the boundary between Maine and New Brunswick was described as the Saint Croix River, and it was soon found to be a difficult matter to determine what was the Saint Croix River. Complaints were made that the British were encroaching upon American territory, and collision between the Americans and the English intruders gave forebodings of international trouble. In 1794 John Jay was charged, among other things, with the settlement of the dispute. The only thing he accomplished in this connection was the securing of a provision in the treaty negotiated by him (see **JAY TREATY**) for the appointment of three commissioners to determine the Saint Croix River. The commissioners met at Halifax in March, 1796, and determined the Saint Croix River, but left unsettled the place of its source. A new difficulty arose over the ownership of the Passamaquoddy Bay Islands, which lie near the mouth of the Saint Croix River. No settlement could be reached on this point until 1814, when an article was incorporated in the Treaty of Ghent for the appointment of a commission to bring about some adjustment. By a decision of the commission rendered in 1817, Moose, Dudley, and Frederick islands were awarded to the United States, the others to Great Britain.

Still another disputed point was the determination of the boundary line from the source of the Saint Croix to the highlands which separate the waters flowing into the Saint Lawrence from those which make their way into the Atlantic Ocean. Various efforts were made by the two governments to reach an agreement on this point, and provisions for this purpose were made in treaties both in 1803 and in 1807, but neither treaty was ever ratified. Finally the Treaty of Ghent provided for the appointment of a commission to settle the dispute, with the reservation that if an agreement could not be reached the disputed question should be referred to the arbitration of a friendly sovereign. The chief task of the commissioners was the determination of the 'northwest angle of Nova Scotia' mentioned in the treaty and the 'northwesternmost head of

the Connecticut River.' The commissioners were unable to agree as to the location of these points. In 1827 a convention was concluded between the two Powers for the reference of the question to the King of the Netherlands. In January, 1831, he made his decision awarding part of the disputed territory to the United States and part to Great Britain. Finding it next to impossible to execute the treaty of 1783, the King drew a boundary line of his own. The decision was satisfactory to neither party, and was formally rejected by the Government of the United States. Meantime border riots and collisions were occurring in the disputed territory to the disturbance of the general peace and security. Several efforts were then made to reach a compromise, but without effect. Finally, the dispute was settled by the Webster-Ashburton Treaty (q.v.) of 1842.

NORTHEAST CAPE. The most northerly point of Asia. See SEVERO CAPE.

NORTHEAST PASSAGE. See POLAR RESEARCH.

NORTHEN, nôr'ten, ADOLF (1828-76). A German battle painter, born at Münden, Hanover. He studied from 1847 to 1851 at the Academy of Düsseldorf, and made that city his permanent home after having declined to accept a Hanoverian stipend coupled with the condition that he should complete his studies under Horace Vernet in Paris. Most of his pictures represent episodes from the campaigns of Napoleon, such as "Encounter Near the Göhrde Forest" (1852, Hildesheim Museum); "Battle of Waterloo" (1855) and "Defense of a Farm" (both in the Hanover Museum); "Napoleon's Retreat from Moscow" (several times); "Episode in Battle of Waterloo" (1861) and "Storming of Planchenois in 1815" (1862, both in the Hamburg Gallery). His observations on the battlefields in Denmark, 1864, and in Bohemia, 1866, resulted in the depiction of various scenes in those campaigns, notably the "Engagement Near Oeverssee" (1866, Rudolphinum, Prague). Although his health was failing at the time of the Franco-German War, he followed the armies to France, and among other war scenes he produced "Attack of Prussian Hussars at Vionville," his last painting.

NORTHER. See COLD WAVE.

NORTHERN LIGHTS. See AURORA BOREALIS.

NORTHERN TERRITORY. A vast region in the northern part of South Australia, under whose control it is (Map: Australia, E 1). It has an area of 523,620 square miles. The Minister appointed to have charge of the district has his official residence at Palmerston. The climate is tropical, and sections of it are well adapted to the growing of tropical plants, particularly sugar-cane. Parts of it are devoted to sheep and cattle grazing, but the greater portion is wholly unoccupied. Tin, copper, silver, and gold are found. A telegraph line connects Port Darwin with Adelaide, and all messages for the southern colonies are received by way of Port Darwin. In 1900 the population, exclusive of aborigines, was estimated at 1560 Europeans, 2200 Chinese, and 515 others. See SOUTH AUSTRALIA.

NORTHFIELD. A town in Franklin County, Mass., 50 miles northwest of Worcester; on the Central Vermont Railroad (Map: Massachu-

setts, C 2). The birthplace of Dwight L. Moody (q.v.), Northfield has become, as a result of his influence, a noted centre of religious education and training, being the seat of Northfield Seminary for Young Ladies, founded in 1879, and the Northfield Training School. Mount Hermon School for Boys, which is associated with the work of Northfield, is in the town of Gill. The annual summer conference of Christian workers and the student conference have made the town of considerable repute as a summer resort. Northfield has the Dickinson Public Library. The inhabitants are interested principally in agriculture. It was incorporated in 1672. Its affairs are administered by town meetings. Population, in 1890, 1869; in 1900, 1866.

NORTHFIELD. A city in Rice County, Minn., 43 miles south of Minneapolis; on the Cannon River, and on the Chicago, Milwaukee and Saint Paul and the Chicago Great Western railroads (Map: Minnesota, E 6). It is the seat of Carleton College (Congregational), opened in 1870, and of Saint Olaf College (Lutheran), opened in 1875, and has an Odd Fellows' Widows' and Orphans' Asylum, Scoville Library, Goodsell Observatory, and a handsome Y. M. C. A. building. The city is the centre of a productive farming section, and has manufactures of brick and woolen knit goods. Settled in 1856, Northfield was chartered as a city in 1875, the charter of that date, as revised in 1889, being still in operation and providing for a government vested in a mayor, elected every two years, and a unicameral council. The water-works are owned and operated by the municipality. Population, in 1890, 2859; in 1900, 3210.

NORTHFIELD. A village in Washington County, Vt., 10 miles south by west of Montpelier, the State capital; on the Dog River, and on the Central Vermont Railway (Map: Vermont, D 5). It is the seat of Norwich University, established in 1819 and incorporated in 1834. The village has a Soldiers' Monument and another to Charles Paine, Governor of the State (1841-43); other features of interest are the neighboring heights, Paine and Bald mountains. Valuable deposits of granite and black slate are found in this vicinity. Granite-working, dairying, and the manufacture of lumber products and woolen goods are the principal industrial interests. The village of Northfield was first incorporated in 1855. There is a municipal electric light plant. Population, in 1890, 1222; in 1900, 1508.

NORTH FLEET. A town in Kent, England, on the Thames, one and one-half miles west of Gravesend (Map: England, G 5). Its industries comprise shipbuilding, chemical works, chalk and lime pits, cement factories, and brick yards. It has an interesting church of the thirteenth century; Huggen's College, established in 1847; and a workingman's club. Population, in 1891, 11,700; in 1901, 13,000.

NORTH FORELAND. See FORELAND, NORTH AND SOUTH.

NORTH GERMAN CONFEDERATION. A union of German States north of the Main, formed in 1866 under the hegemony of Prussia, following on the defeat of Austria in the Seven Weeks' War (q.v.) and the dissolution of the Germanic Confederation. (See GERMANY.) It

was first organized in August with 18 States, the number being increased to 22 before the end of October. A constitution was adopted which, with slight modifications, is that of the present Germany. Offensive and defensive alliances were concluded with Bavaria, Baden, and Württemberg, by which these States agreed to place, in case of war, their military forces under the command of the King of Prussia. The Franco-German War brought complete unity to Germany. On January 18, 1871, the King of Prussia, at Versailles, assumed the title of German Emperor, and in April the Constitution of the Confederation, so amended as to provide for the rights of the newly admitted South German States, was promulgated for the Empire.

NORTH HOLLAND. A province of the Netherlands occupying the peninsula lying between the Zuider Zee and the North Sea, and bounded on the south by the provinces of Utrecht and South Holland (Map: Netherlands, C 2). It includes also the islands of Texel and Vlieland of the West Friesian Islands. Area, 1069 square miles. The province contains but little forest, the greater part being low meadow and moorland protected along the coast by dunes and dikes. Agriculture, gardening, and cattle-raising, and in the cities linen manufacturing are the principal industries. The province is traversed by a number of canals, the most important of which are the North Holland Canal, between Amsterdam and Helder, and the North Sea Canal, connecting the Zuyder Zee and the North Sea directly. Population, in 1899, 968,106. The capital is Haarlem and the largest city is Amsterdam. For history, see HOLLAND; NETHERLANDS.

NORTHINGTON, ROBERT HENLEY, Earl of (c.1708-72). An English Lord Chancellor, son of Anthony Henley. Educated at Westminster, and at Saint John's and All Souls', Oxford, he studied at the Inner Temple. For ten years he was a representative of Bath in Parliament, and afterwards he became Attorney-General, Keeper of the Great Seal, and Speaker of the House of Lords. In 1760 he was made Lord Henley and presided at the trial of Lord Ferrers. The year following he became Lord Chancellor. He retired from the Chancellorship in 1767. He was a great favorite of George III., and was commonly known as 'Tom Tilbury' or 'Surly Bob.' Consult Lord Henley's *Memoir* (London, 1831).

NORTH ISLAND. See NEW ZEALAND.

NORTHMEN. See NORMANS.

NORTH PLATTE. The county-seat of Lincoln County, Neb., 294 miles west of Omaha; at the junction of the North and South Platte rivers, and on the Union Pacific Railroad (Map: Nebraska, D 2). It has a United States land office, a Y. M. C. A. library, with about 2000 volumes, and a high school that cost \$35,000. The industrial establishments include railroad machine shops, employing several hundred men, and a cold storage plant. North Platte is the centre of an irrigated section, and is an important shipping point for alfalfa, sugar beets, and cattle. Population, in 1890, 3055; in 1900, 3640.

NORTH RIVER. The name applied to the lower course of the Hudson River.

NORTHEOP, nŏrth'ŕŭp, CYRUS (1834-). An American educator, born in Ridgefield, Conn.

He graduated at Yale in 1857, and at the law school there in 1859. Two years later he was appointed clerk of the Connecticut House of Representatives, and in 1862 of the Senate. In 1863 he was made professor of rhetoric and English literature in Yale, and he held this chair until 1884, when he became president of the University of Minnesota.

NORTH SEA, or GERMAN OCEAN (Lat. *Germanicum Mare*, Ger. *Nord See*, Dan. *Vesterhavet*, West Sea). That part of the Atlantic between the eastern coast of Great Britain and the Continent of Europe (Map: Europe, D 3). It is pear-shaped in general outline, with a wide opening northward into that part of the Atlantic Ocean known as the Norwegian Sea, and with a narrowing arm extending from the main oval body southward to the Strait of Dover, which, with the English Channel, forms the southern communication with the Atlantic. On the east the Skagerrak leads between Jutland and Norway into the Cattegat, which connects through the Sound and the Great and Little Belts with the Baltic Sea. The greatest width of the North Sea, between Dundee, Scotland, and the entrance of the Limfjord in Jutland, is 412 miles; its greatest length from north to south is 680 miles; and its area is about 200,000 square miles, of which 2500 square miles are occupied by islands. A number of large rivers flow into the southern part of the North Sea; the chief of these are the Elbe, Weser, Ems, Rhine, which is joined at its mouth by the Meuse, and Scheldt on the Continent, and the Thames and the Humber in Great Britain. These render the water less saline than that of the main ocean, though the salinity is greater than that of the Baltic, the percentage of salty constituents being 1.025 in the southern part of the sea. They also contribute their sediment to the formation of the numerous shoals and sandbanks which line the southern and southeastern shores. These shores are very low, the land in many places lying below the sea-level. They have been much encroached upon by inundations, which have left the higher portions of the former coast-line as a chain of islands. Behind these are a series of shallow lagoons and inlets, of which the most notable are the Jade (q.v.) in Germany, and the Zuyder Zee (q.v.) in Holland.

In general the depth of the North Sea increases gradually northward. The mean depth of the southern portion is about 100 feet, near the middle it is 250, and in the north 400 feet. Along the steep, rocky coast of Norway there runs a trough with a depth of nearly 1000 feet within 20 miles of the shore. On the other hand, there are in the southern half of the sea, besides the shoals mentioned along the coast, several shallow regions rising considerably above the mean level of the bottom. Among these the Dogger Bank occupies a large portion of the south-central part of the sea, with a depth of 60 to 100 feet, the surrounding depths being 150 to 200 feet. The tides of the North Sea are very irregular, owing to the fact that two tidal waves enter it, one from the north and one from the south. The former sweeps southward along the west shore, the latter northward along the eastern coast. Midway between the shores there seems to be very little rise and fall and at some points none at all, while in some places on the southern shore, where the two waves unite, there is a difference

of 20 feet between high and low tide. The winds on the North Sea are variable, those from the west being the most prevalent. Rain and fogs occur at all seasons, and the violent northwest storms blowing toward the shoals on the southeast coast make navigation there exceedingly dangerous, especially along the coast of Jutland. Nevertheless, owing to its favorable position, the North Sea is one of the most frequented and most important commercial highways of the world. Its fisheries are also among the foremost, providing support for many thousand inhabitants of the surrounding countries.

By means of the Kaiser Wilhelm Canal ships can now enter the Baltic Sea without making the passage around Jutland.

Consult: Fulton, "On the Currents of the North Sea, and Their Relation to Fisheries," *Scotland Fishery Board Report for 1896*; Haas, *Deutsche Nordsee Küste, friesische Inseln und Helgoland* (Bielefeld, 1900).

NORTH SHIELDS. A seaport of England. See SHIELDS, SOUTH AND NORTH.

NORTH STAR, ORDER OF THE. A Swedish civil order of merit with four classes, founded in 1748 by Frederick I. The decoration is an eight-pointed white star surmounted by a crown and suspended from a black ribbon. The round, blue shield bears the polar star with five rays, and the device "Nescit occasum" ("It never sets"). It is conferred especially for notable scientific achievements. See Plate under ORDERS.

NORTH TONAWANDA, tōn'a-wōn'dā. A city in Niagara County, N. Y., 10 miles north of Buffalo; on the Niagara River, at the mouth of Tonawanda Creek, which separates the city from Tonawanda, also on the Erie Canal, and on the Erie, the Lehigh Valley, and the New York Central railroads (Map: New York, B 3). Several other lines pass through the city on leased roads. It is an important industrial and commercial centre, known especially for its lumber and iron interests. There is an extensive production of pig iron, nuts and bolts, barrel organs, and steam merry-go-rounds. The manufactures include also roofing material, steam piping, steam radiators, steam pumps, and miniature railroads. According to the census of 1900, an aggregate capital of \$5,027,000 was invested in the various industries, the production of which was valued at \$6,448,000. There is a public library with over 5400 volumes. North Tonawanda, chartered as a city in 1897, is governed by a mayor, chosen every two years, and a unicameral council, elected two from each ward and three at large. The water-works are owned and operated by the municipality. Population, in 1890, 4793; in 1900, 9069.

NORTHUMB'ERLAND. The northernmost county of England, bounded on the east by the North Sea, and on the south, in part, by the River Tyne (Map: England, D 1). The River Tweed and the Cheviot Hills are on the Scottish border. The whole surface, except the narrow coastal region, is uneven, with rounded hills, moorlands, and fertile wooded valleys. The summers are cooler, but the winters milder, than in the southern counties. The coast region and the valleys are cultivated, producing turnips and cereals; the western part is largely pastoral. The chief industries are coal-mining and the

manufactures which depend upon the coal supply; the salmon fisheries are also of importance. Population, in 1891, 506,030; in 1901, 602,900. The county returns four members to Parliament. Newcastle-upon-Tyne, the chief city of Northumberland, is a separate county borough. Among the considerable towns are Tynemouth, Wallsend, and Cowpen. Northumberland contains numerous historic landmarks, including remains of Hadrian's Wall and of Roman military roads and famous battlefields of the Scottish wars.

BIBLIOGRAPHY. Hodgson, *History of Northumberland* (Newcastle, 1820-40), is the standard work, and is continued in Hodgson-Hinde, *General History of Northumberland* (Newcastle, 1858). Materials collected by Hodgson are also used in Bateson, *History of Northumberland* (12 vols., Newcastle, 1893 et seq.), an elaborate and complete work. Consult also: Gibson, *Northumberland Castles, Churches, and Antiquities* (London, 1848-54); Hartshorne, *Feudal and Military Antiquities of Northumberland* (Oxford, 1858); Bruce, *Roman Wall* (London, 1874); Lebour, *Geology of Northumberland and Durham* (Newcastle, 1886); Andrews, *Bygone Northumberland* (London, 1899); and the *Proceedings of the Surtees Society* (Durham, 1835 et seq.).

NORTHUMBERLAND, EARLS OF. See PERCY.

NORTHUMBERLAND, JOHN DUDLEY, Duke of. An English politician, father-in-law of Lady Jane Grey, whom he plotted to place on the throne of England. See GREY, LADY JANE.

NORTHUMBERLAND, ROBERT DE MOWBRAY, Earl of (?-c.1125). An English baron, whose father and uncle came over with William the Conqueror. He was created Earl of Northumberland about 1081, and seven years afterwards fought to support Robert of Normandy's claim to the English crown against that of the latter's younger brother, William Rufus. He burned Bath, besieged Ilchester, carried fire and sword over western Wiltshire, and then began a conflict with the Bishop of Durham. His next antagonist was King Malcolm of Scotland, whom he slew near Alnwick in 1093, and two years afterwards he headed an insurrection against William II. in favor of his cousin, the Count d'Aumale. The King besieged Northumberland in his strong castle at Bamborough, and the Earl, being lured therefrom on a pretense, was captured after a stout resistance at Tynemouth Monastery. It is supposed that he was kept a prisoner for the remainder of his life.

NORTHUMB'RIA (ML. *Northumbria*, from AS. *norþ*, north + *Humbre*, Humber). In Anglo-Saxon England, a kingdom of the Heptarchy (q.v.) formed out of the two earlier kingdoms of Bernicia, established by Ida in 547, and extending from the Forth to the Tees, and Deira, extending from the Tees to the Humber. Æthelric of Bernicia in 588 drove out Ælla of Deira and united the two under his rule. Under Oswald (died 642) it was the strongest kingdom in the Heptarchy and the champion of Christianity against pagan Mercia. Its separate existence was brought to an end by Egbert in 827. The name survives in the modern county of Northumberland.

NORTHWEST BOUNDARY DISPUTE. The dispute between the United States and Great

Britain concerning the northwest boundary of the United States. By the Treaty of Ghent, concluded between the two governments, December 24, 1814, provision was made for the appointment of two commissions to determine the northern boundary from the Saint Lawrence River to Lake Superior, and from Lake Superior to the Lake of the Woods. At the same time the American commissioners proposed the 49th parallel from the Lake of the Woods to the Rocky Mountains as a continuation of the northern boundary between the United States and Canada. This proposition, however, was not acceptable to the British negotiators, nor was any agreement upon the subject reached at the time. Meanwhile the occupation of Oregon had extended the boundary dispute to the territory west of the Rocky Mountains. Russia, which claimed part of Oregon, ceded her claims of all territory south of 54° 40' N. lat. to the United States in 1824. Spain also claimed Oregon on the ground of discovery, but by the treaty of 1819 quitclaimed her title to land north of the 42d parallel to the United States, leaving Great Britain and the United States as the only disputants. By the convention of 1818 the two governments accepted the 49th parallel as the boundary between Canada and the United States from the Lake of the Woods to the Rocky Mountains. The proposition of the United States to accept a continuation of that line to the Pacific as a suitable division of the Oregon country between the two claimants was rejected by Great Britain on the ground that it would give the Columbia River to the United States. After fruitless negotiations, the United States agreed to accept an arrangement by which the two Powers were to occupy the Oregon territory jointly for a period of ten years. This was embodied in the convention of 1818. By a convention concluded at London, August 6, 1827, the two governments agreed to extend indefinitely the stipulation of 1818 for joint occupation, with the reservation that the convention was subject to abrogation after October 20, 1828, by either party giving twelve months' notice. During the administration of President Tyler negotiations for the permanent settlement of the dispute were carried on between Secretary of State Calhoun and the British Minister Pakenham, who offered to accept the 49th parallel as far as the Columbia River, and from thence onward the Columbia River itself, as the boundary. The Government of the United States declined to accept this proposition, as well as a proposition to submit the question to arbitration. The American public, moreover, was very insistent that no essential rights be waived, and the popular opposition to the making of any concession gave rise to the political watchword, "Fifty-four forty, or fight." Matters thus stood when the Presidential election of 1844 occurred. The Democratic Party, in its national platform, asserted the right of the United States to the whole of Oregon, and won the election partly on this issue. Notwithstanding this emphatic position of the party, the new Administration resumed the negotiations, offering substantially the same proposition as Calhoun had offered. This was refused by the British Government, whereupon negotiations were broken off. The President formally withdrew the proposal and reasserted our "rightful claim to the whole of Ore-

gon." In April, 1846, Congress authorized the President at his discretion to give the notice required by the convention of 1827 for its abrogation, and this was accordingly done. Finally the dispute was amicably settled by a treaty concluded in July following (1846), by which it was provided that the boundary line should be the 49th parallel to the middle of the channel which separates Vancouver's Island from the continent, and thence southerly through the channel, and the Straits of Juan de Fuca to the Pacific Ocean, the navigation of the channel and straits to remain free and open to both parties. A subsequent dispute between the two governments as to the meaning of the provisions in respect to the channel was referred to the German Emperor (1871) as arbitrator. He decided the following year in favor of the American claim. See **SAN JUAN BOUNDARY DISPUTE.**

NORTHWESTERN UNIVERSITY. A co-educational institution at Evanston-Chicago, Ill., in affiliation with the Methodist Episcopal Church, founded in 1851. It comprises a college of liberal arts, and schools of law, medicine, pharmacy, dentistry, and music and oratory. The college of liberal arts and the school of music are at Evanston, the professional schools in Chicago. Students are admitted on certificate from accredited schools or on examination in three groups of studies. The courses in the college lead to the bachelor's and master's degrees in arts, philosophy, science, and letters, and to the degree of doctor of philosophy. The college course is largely elective after the second year, and provision is made for advanced credits by which the time required for subsequent professional studies may be shortened. Advanced courses in certain departments are offered to graduate students, but this work is not organized into a distinct graduate school. Two schools of preparatory instruction are maintained by the university, the Academy, in Evanston, and the Grand Prairie Seminary at Onarga. The Garrett Biblical Institute, under Methodist Episcopal control, forms the theological department of the university, and maintains close relations with the Norwegian-Danish Theological School and the Swedish Theological Seminary, both at Evanston. In 1903 the university had 305 instructors and 3691 students, of whom 769 attended the college. The college campus covers about 45 acres, on the shores of Lake Michigan, with well-equipped buildings, including the Dearborn Observatory and the Library building, the latter containing the general and Greenleaf libraries, with about 52,000 volumes and 33,000 pamphlets. The endowment in 1902 was \$4,000,000, the income \$465,000, and the total value of property under the control of the colleges, \$6,761,250.

NORTHWEST FRONTIER PROVINCE. A province of British India, bounded on the west and north by Afghanistan, on the east by Kashmir and the Punjab, and on the south by Baluchistan. It was formed in 1901 by separating from the Punjab the District of Peshawar and other portions lying mainly west of the Indus. These districts, which are directly under British administration, have an area of 16,466 square miles, and had a population in 1901 of 2,125,490. The Chief Commissioner of the province has also political control over the remaining region along

the Afghan frontier, a country covered by the Suleiman Mountains. About 2,500,000 acres of the districts around Peshawar are cultivated, and a large portion of this area is irrigated. The capital of the province is Peshawar (q.v.).

NORTHWEST PASSAGE. See POLAR RESEARCH.

NORTHWEST PROVINCES. The former designation of the United Provinces of Agra and Oudh, British India.

NORTHWEST TERRITORIES. The designation for the sparsely inhabited region of Canada which includes the organized territories of Assiniboia, with a land area of 90,340 square miles; Alberta, about 100,000 square miles; and Saskatchewan, 114,000 square miles; and the unorganized territories of Athabasca, about 251,300 square miles of land area; Mackenzie, about 563,200 square miles; Ungava, about 456,000 square miles; and Franklin, about 300,000 square miles. The term 'Northwest Territories' probably referred originally to the region over which the Northwest Company exercised authority, the territorial limits of which do not seem to have ever been clearly defined. An Imperial act of 1868 enabled the Crown to accept of the Hudson's Bay Company the surrender of the lands known as Rupert's Land, the limits of which were also indefinite, for admission into the Dominion. An act of 1869 provided that Rupert's Land and the Northwest Territories be admitted as a part of Canada under the name of the Northwest Territories. In 1870 Manitoba was made a province, under which in 1876 Keewatin was made a district. Manitoba was slightly enlarged in 1881, and in 1898 the Yukon Territory was established. In 1882 the districts of Assiniboia, Saskatchewan, Alberta, and Athabasca were formed, and in 1895 the remaining portion was divided into the districts of Ungava, Mackenzie, and Franklin. Of the Northwest Territories, a portion of the southwest belongs to the greater interior American Plain, and is less broken than the region farther north, much of it being prairie. North of this prairie region lies an immense wooded area. As the inhospitable Arctic regions are approached the forest growth becomes very scanty or disappears entirely, so that there is a very considerable area of barren land where little is found save lichens and mosses. The northern portion of the Northwest Territories is mainly a broken plain draining into the Arctic Sea. The greater part of the Northwest Territories is characterized by short summers and long and very severe winters. For a fuller statement of physical conditions, see CANADA.

A large variety of minerals is known to exist, bituminous coal and lignite being very abundant in southern Alberta. Coal is mined in considerable quantities in the foothills of that region. In the southwest the soil is generally very fertile, and the climatic conditions are such that hardy crops can be profitably grown. This region is practically all comprehended in the districts of Assiniboia, Alberta, and Saskatchewan. In the census of 1901 it was found that 6,569,064 acres of this region, or 3.50 per cent. of the land surface, is occupied as farms and lots. Of the 22,813 farms of five acres and over, 64.08 per cent. were between 100 and 201 acres each. Over 93 per cent. of the farmers owned the farms they occupied. Over 24 per cent. of

the farm land was in an improved state. Hay leads in respect to acreage, 155,870 acres in 1891, 831,157 in 1901. The acreage of wheat increased during the same period from 113,811 in 1891 to 530,274 in 1901, and oats gained from 61,637 acres to 259,552. In the latter year there were 22,897 acres in barley, 9925 acres in potatoes, and 15,095 in forage crops for winter feeding. Small fruits are successfully raised, but the climatic conditions are not favorable for orchards. The increase in the live stock was equally marked, as is seen in the following table:

LIVE STOCK	1901	1891
Horses three years and over.....	132,942	39,267
Horses under three years.....	43,520	21,709
Milch cows.....	102,785	37,008
Other horned cattle.....	489,004	194,824
Sheep.....	154,152	64,920
Swine.....	73,926	16,263

The prairie land affords excellent facilities for pasturage. Only the three southernmost districts have the advantage of railroad transportation. Settlements are being made in the territories of Alberta, Assiniboia, and Saskatchewan, and the total population of this area increased from 66,799 in 1891 to 158,940 in 1901, of whom a little over one-sixth are in Saskatchewan, and the remainder about evenly divided between Alberta and Assiniboia. In Ungava, Franklin, and Mackenzie there are large areas as yet unvisited by white man. The population of this region, together with Athabasca and Keewatin, increased from 32,168 in 1891 to 52,709 in 1901. There is a scattered Indian population in the Northwest Territories and Keewatin, amounting in 1900 to 27,057, besides about half that number of half-breeds. The Northwest Territories are under the administration of a Lieutenant-Governor, appointed by the Governor or Council of the Dominion. He has an executive council of three members. There is a Legislative Assembly of 31 members. Only Alberta, Assiniboia, and Saskatchewan have a form of local government with representation in the legislature. The Territorial Government meets at Regina. For a more detailed statement concerning settlements, etc., see under titles of the separate districts. Consult Blanchard, *The Discovery and Conquest of the Northwest* (Chicago, 1880).

NORTHWEST TERRITORY. In American history, that portion of the national domain lying, roughly speaking, north of the Ohio River, east of the Mississippi, south of the Great Lakes, and west of Pennsylvania, and embracing territory which constitutes the present States of Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota—a total area of about 265,878 square miles. This territory passed into the possession of Great Britain by the Treaty of Paris in 1763, and by her was ceded to the United States of America in 1783. The greater part of it was claimed on the basis of their early charters, by Virginia, New York, Massachusetts, and Connecticut. The other States refused to recognize these claims, and insisted that this territory should belong to the country as a whole. In 1780 Congress gave a solemn pledge that if the lands thus claimed were ceded to the Confederation they should be disposed of for the common benefit of all the States and admitted into the Union

as republican States, and on an equal footing with the original States. On the strength of this pledge New York ceded her claims in 1781, Virginia hers in 1784, Massachusetts hers in 1785, and Connecticut hers in 1786. All of these colonies, however, reserved for special purposes certain lands from the cession. Thus Virginia retained in what is now the southern part of Ohio a considerable area, known as the Virginia Military District, and Connecticut retained 3,250,000 acres, known as the Western Reserve (q.v.), in what is now the northern part of Ohio. By an ordinance of 1785 Congress made provision for surveying the lands thus ceded. The lands were then thrown open for sale, and the result was a great influx of immigrants from the older States. On the first of March, 1784, the very day on which Virginia completed her cession, Jefferson, as chairman of a committee, reported to Congress a temporary plan of government which was adopted on April 23d. Jefferson's scheme contemplated the division of the territory into new States, divided by lines of latitude two degrees apart, and intersected by two meridians of longitude to be drawn through the mouth of the Kanawha and the falls of the Ohio, and to the new States thus created were to be given the names of Sylvania, Michigania, Chersonesus, Assenisipia, Mesopotamia, Illinois, Washington, Polypotamia, and Pelisipia. The ordinance further provided that after the year 1800 neither slavery nor involuntary servitude should exist in any of the said States except as a punishment for crime. This ordinance never went into effect, and was repealed by the celebrated ordinance of 1787. This latter ordinance was prepared by a committee of which Nathan Dane, of Massachusetts, was chairman, and received the approval of Congress, July 13, 1787. It was a constitution of government for the Northwest Territory, and contained, besides, six articles of compact between the old States and the new States to be created out of the said territory. It provided that there should be formed out of the territory in question not less than three or more than five States, and undertook to define their boundaries. For the purposes of temporary government this vast domain was constituted into one district, and was committed to the rule of a governor, a secretary, and three judges, all appointed by Congress. Until the election of a legislature, the Governor and the judges sitting together were authorized to adopt such laws of the original States as they deemed necessary and suitable, subject to the approval of Congress. Provision was made for a legislature to be called into existence as soon as there were 5000 free male inhabitants of full age in the territory. It was to consist of a Legislative Council composed of five members chosen by Congress, and a House of Representatives chosen by freeholders. There were also a number of organic provisions regarding land tenure, taxation, inheritances, and the alienation of property. The articles of compact constituted a sort of bill of rights, and guaranteed freedom of religious worship and belief, the privilege of the writ of habeas corpus, trial by jury, benefit of the common law, the security of private contracts, and freedom of navigable waters. Finally the Northwest Territory was dedicated to freedom by the famous article that prohibited slavery and

involuntary servitude. In October, 1787, General Arthur St. Clair, a veteran of the French and Revolutionary Wars, was appointed the first Governor of the Territory. In July of the following year he reached Marietta, the seat of government for the Territory, and his first act was an order for the creation of Washington County. Shortly thereafter he appointed a number of magistrates and established a Court of Quarter Sessions. In 1798, the population having far exceeded the required number, a legislature was called and met for the first time at Cincinnati, September 24, 1799. The Lower House consisted of 22 members, representing the nine counties of the Territory. In July, 1800, the western part of the Territory was constituted into the District of Indiana, with William Henry Harrison as Governor, and with Vincennes as capital. In January, 1805, Michigan Territory was created, with Gen. William Hull as Governor; in February, 1809, the Illinois Territory was organized, with Kaskaskia as its seat of government, and in April, 1836, part of Michigan Territory was organized into the Territory of Wisconsin. Consult: Hinsdale, *The Old Northwest* (New York, 1891); and Moore, *The Northwest Under Three Flags* (New York, 1900).

NORTHWICH, north'wich. A market-town and railway junction in Cheshire, England, at the confluence of the Weaver and Dane, nine miles south-southeast of Warrington (Map: England, D 3). It is noted for its salt mines, brine springs, and supplemental industries. The town has an ancient and dilapidated appearance, owing to land subsidences wrought by the mining and brine-pumping. The Marston mine, 300 feet deep, its vault supported by enormous salt pillars, is the most picturesque of the excavations. The municipality is progressive; maintains a free public library, technical schools, gymnasium, and park; owns remunerative markets, water-works and public baths, which include medicinal brine baths. The brine springs have been worked from prehistoric times. During the Civil War Northwich was fortified by Parliament, and was the scene of exciting encounters. Population, in 1891, 15,000; 1901, 17,600.

NORTON, ANDREWS (1786-1853). An American theologian and scholar. He was born at Hingham, Mass., and graduated from Harvard College in 1804. He studied theology and in 1809 became a tutor in Bowdoin College. He went to Harvard in 1811 to teach mathematics, but resigned the next year to conduct the *General Repository*, a magazine devoted to the propagation of liberal Christianity. In 1813 he was made librarian of Harvard, in addition to which he was appointed lecturer on the criticism and interpretation of the Scriptures. He was in the Harvard Divinity School, 1819-30, Dexter professor of sacred literature. The remainder of his life was devoted to literary pursuits. His first work of importance was *A Statement of Reasons for Not Believing the Doctrine of Trinitarians concerning the Nature of God and the Person of Christ* (1833; new edition with memoir by W. Newell, 1856; 11th ed., 1876). In 1833 he became associated with Charles Folsom in the publication of the *Select Journal of Foreign Periodical Literature*. Other works of importance were: *Evidences of the Genuineness of the Gospels* (1837-44), and *On the Latest Form of*

Infidelity (1839). Specimens of his verse may be seen in *Griwald's Poets and Poetry of America* (Philadelphia, 1842).

NORTON, CAROLINE ELIZABETH SARAH (1808-77). A British author, born in London. Her father was Thomas Sheridan, and her grandfather Richard Brinsley Sheridan (q.v.). Her talent developed at an early age, and when only thirteen she wrote *The Dandies' Rout*. Her *Sorrows of Rosalie: a Tale, with Other Poems*, appeared in 1829, two years after her unfortunate marriage to an impecunious barrister, the Hon. George Chapple Norton, whom she virtually supported for many years. Her marital troubles led her to publish a pamphlet on *English Laws for Women in the Nineteenth Century*, which, together with some other writings, undoubtedly had considerable influence in causing those laws to be changed. Her reputation rests chiefly upon her poems, most of which were written in the style of Byron, though a few, like "The Faded Flower" and "Joe Steel," show that she could have written equally well in quite a different vein had she so chosen. Among her other works are *A Voice from the Factories* (1836), and *The Child of the Islands* (1845).

NORTON, CHARLES BOWYER ADDEBLEY, first Baron (1814—). An English public man, born in Knighton, Leicestershire. He graduated at Christ Church in 1835, and was Conservative member of Parliament for North Staffordshire in 1841-78. During that time he was president of the Board of Health, vice-president of the Education Council (1858-59), Colonial Under Secretary (1866-68), and president of the Board of Trade (1874-78). He was knighted (1869) and made a peer of the realm (1878), with a title taken from his estate, Norton-on-the-Moors, Staffordshire. He interested himself in education, particularly in reformatory schools, and published books on the subject, besides one on *Socialism* (1896) and another on *High and Low Church* (1898).

NORTON, CHARLES ELIOT (1827—). An American scholar, son of Andrews Norton. He was graduated from Harvard in 1846, and began his career in a business house in Boston engaged in the India trade. In 1849 he went to India and to Europe, and thenceforth devoted himself to scholarship and literature. During the Civil War he was editor of the *Loyal Publication Society* papers, and from 1864 to 1868 was editor, with J. R. Lowell, of *The North American Review*. In 1875 he became professor of the history of art in Harvard University, and was made professor emeritus in 1900. He came to stand, more than any other American perhaps, for the finer ideals of culture, and was in consequence often misjudged for utterances which seemed unpatriotic, but were really inspired by a desire to promote the higher interests of his fellow citizens. His work in literature, which deals chiefly with Italy, consists of: *Considerations on Some Recent Social Theories* (1853); *The New Life of Dante* (1859; parts translated with essays; complete translation in 1867); *Notes of Travel and Study in Italy* (1860); *Historical Study of Church-Building in the Middle Ages* (1880); *The Divine Comedy of Dante* (1891-92), a very helpful prose translation. He was also the literary executor and editor of several important men of letters, as Lowell, Carlyle, Emerson, G. W. Curtis, Ruskin

(the "Brantwood Edition"), and A. H. Clough (*Poems*), of all of whom he was a personal friend.

NORTON, CHARLES LEDYARD (1837—). An American journalist and author, born in Farmington, Conn., and educated at Yale, where he graduated in 1859. He continued his studies at the Sheffield Scientific School until the outbreak of the Civil War, when he enlisted in the Seventh Regiment, New York State National Guard. In 1862 he was appointed captain in the Twenty-fifth Connecticut Volunteers, and from 1863 until he was mustered out in 1866 was colonel of the Seventy-eighth Regiment United States colored troops, with main duties in the Department of the Gulf. He commanded a large district in western Louisiana during the early months of reconstruction, and then for a year was manager of a cotton plantation in southern Louisiana. Forced by ill health to turn to literary pursuits, he edited the *Christian Union* from 1868 to 1878, and was subsequently connected editorially with the *Domestic Monthly*, *Our Continent*, and *Outing*. His published works include: *Canoeing in Kanuckia* (with John Habberton, 1878); *A Handbook of Florida* (3d ed. 1892); *Political Americanisms* (1890); and *Jack Benson's Log* (1895).

NORTON, FRANK HENRY (1836—). An American author and journalist, born in Hingham, Mass., and educated at the Dwight School in Boston and at the Pictou Academy, Nova Scotia. He was assistant librarian and then assistant superintendent of the Astor Library, New York City, from 1855 to 1865, and from 1866 to 1867 was head librarian of the Mercantile Library of Brooklyn. In 1872 he entered journalism, from 1879 to 1881 was editor and owner of the *New York Era*, and from 1883 to 1891 was a member of the *New York Herald* staff. He wrote various burlesques and melodramas, among which are *Alhambra*, *Azrael*, *Cupid and Psyche*, and *Leonie*, and published *Historical Register of the Centennial Exhibition, 1876, and of the Paris Exposition, 1878* (1878); *Life of Winfield Scott Hancock* (with D. K. Junkin, 1880); *Life of Alexander H. Stephens* (1883); *Daniel Boone* (1883); and *The Malachite Cross* (1894).

NORTON, SIDNEY AUGUSTUS (1835—). An American chemist, born at Bloomfield, Trumbull County, Ohio. He graduated at Union College in 1856, and at the Miami Medical College in 1867, and studied chemistry at Bonn, Leipzig, and Heidelberg. He then taught for a number of years, and in 1873 was appointed professor of chemistry at the Ohio State University. He published: *Elements of Natural Philosophy* (1870); *Essays and Notes* (1874); *Elements of Physics* (1875); *Elements of Inorganic Chemistry* (1878); and *Organic Chemistry* (1884).

NORTON, THOMAS (1532-84). An English poet, born in London. When a boy he became amanuensis to the Protector Somerset; and at the age of eighteen published a translation of the "Letter which Peter Martyr wrote to the Duke of Somerset," a valuable document, as the original is lost. In 1555 he entered the Inner Temple as student, and afterwards practiced law, becoming counsel for the Stationers' Company (1562), and solicitor to the Merchant Tailors' Company (1581). Entering Parliament in 1558,

he was soon known as a bold and eloquent debater. He took an active part against the Catholics; and as licenser of the press, was engaged in several most cruel tortures. Toward the close of his life he was imprisoned for a short time in the Tower on a charge of treason. He died March 10, 1584. Norton wrote much verse in English and Latin. He is, however, most remembered for his share in *Gorboduc*, the first English tragedy in blank verse (performed in the hall of the Inner Temple on Twelfth Night, 1560-61). The first three acts were written by Norton; the last two by Thomas Sackville (q.v.).

NORTON, THOMAS HERBERT (1851—). An American chemist, born at Rushford, N. Y. He studied at Hamilton College and at the University of Heidelberg, and then held the post of manager in a large chemical factory in Paris. In 1883 Norton was chosen professor of chemistry and librarian in the University of Cincinnati. He traveled afoot through Greece and Syria, and in May, 1900, was appointed by President McKinley to establish the American consulate in Kharput, Turkey, as a recognition of his knowledge of the Orient.

NORTON SOUND. An arm of Bering Sea, on the west coast of Alaska, south of Cape Prince of Wales (Map: Alaska, C 3). It is 200 miles wide at its entrance, extends about the same distance into Alaska, and receives the waters of the Yukon River. It is ice-bound from October to June. Norton Sound was discovered by Captain Cook in 1778.

NORUMBEGA. A name given by early explorers and map-makers to various portions of the eastern coast of North America, and also to a river and a mythical city. Upon the map of Verrazano's voyages, published 1529, Aranbega appears as a place on the New England coast. The narrative of the anonymous "Dieppe Captain," in 1539, makes Norumbega stretch from Cape Breton to Florida. Mercator's map of 1541 apparently locates Anorumbega around the Hudson River, and that of 1569 represents Norumbega as a city with high towers. Jean Allefonse, the pilot of the Cartier-Roberval expedition (1541-44), speaks of a great river, brackish forty leagues from its mouth, rocky, and filled with islands. This has been variously identified as the Hudson, Long Island Sound, and the Penobscot. Gastaldi's map, in 1556, makes Nurumbega the region near Cape Breton, while Thevet, in the same year, apparently makes the Norumbega the Hudson. David Ingram, a sailor, claimed that in 1568 he was put ashore on the Gulf of Mexico by Sir John Hawkins and made his way by Indian trails to the Saint John's River in Canada in 1569. While passing through Norumbega on his route he visited a city three-fourths of a mile through, the houses of which had pillars of crystal and silver. He saw a peck of pearls and rubies six inches long, while all the inhabitants had heavy ornaments of gold, and the richest furs were plentiful. This story was printed by Hakluyt in his *Principall Navigations* (1589), but Sir Humphrey Gilbert secured a copy before, and, in 1583, set out to explore the country. With him he carried the poet Parmenius to sing the praises of the country. Michael Lok's map, in 1582, represents the Penobscot as a strait reaching to the Saint Lawrence, and makes Norumbega the country included between the two. Other

maps of the sixteenth century locate the country in New England and indicate a city about the 43d degree. Champlain, in his explorations of the Maine coast (1604-06), searched for the city, and ascended the Penobscot to the site of the present city of Bangor, but found no trace. The name begins to disappear in the seventeenth century; but John Smith, in 1620, applies it to New England and the coast down to Virginia, while Lucini, an Italian engraver, represents it as alternative with Nova Anglia in 1647. Heylin, in 1669, still dreams of a wonderful city.

The etymology of the word 'Norumbega' is vague and uncertain. Grotius first identified the term with Norbergia, and suggested a Norse origin. Prof. E. N. Horsford derives it from *Norvegr*, Norway, and identifies the river with the Charles. He claims to have discovered ruins of a Norse city, subsequently occupied by Breton French, near Watertown, Mass., and in 1889 he erected a memorial tower at the junction of Stony Brook and the Charles. An Indian origin meaning 'still water,' or 'place of a great city,' has been suggested, while others call attention to the Spanish 'vagas,' or 'bagas,' fields. Weise, in his *Discoveries of America to 1525* (New York, 1884), derives the name from the Old French *L'Anormée Berge*, the Grand Scarp, i.e. the Palisades. Fiske also identifies the Hudson as the Norumbega River and locates an old French city on Manhattan Island.

Consult: Winsor, *Narrative and Critical History of America*, vols. iii.-iv. (Boston and New York, 1884); Beauvois, *La Norumbegue* (Brussels, 1880); Fiske, *Dutch and Quaker Colonies in America*, vol. vi. (Boston and New York, 1899); Horsford, *Defenses of Norumbega* (Boston, 1891), and *Discovery of Ancient City of Norumbega* (privately printed, 1890).

NORVAL, nôr'val. The son of Lady Randolph and her first husband in Home's tragedy *Douglas*. He was exposed at birth and brought up by an old shepherd, Norval, whose name he took. His identity was discovered by his mother after he had saved Lord Randolph's life, and he was advanced by his stepfather, but was killed by him as the result of jealousy aroused by Glenalvon, Randolph's heir presumptive. His mother then took her own life. The part was played by both Kemble and Macready.

NORWALK, nôr'wak. A city in Fairfield County, Conn., 14 miles west by south of Bridgeport; on the Norwalk River, near Long Island Sound, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, B 5). It is attractively situated on the Sound, and is a popular residential place as well as a noted summer resort. Its more prominent buildings include the Carnegie Library, Norwalk Hospital, Fairfield County Children's Home, and the State Armory. There are extensive manufactures of hats, corsets, shirts, shoes, cassimeres, felt goods, silks, locks, air compressors, etc. The oyster interests also are important, and considerable coastwise trade is carried on. The New York and Norwalk steamboat line maintains regular service to New York. The government is vested in a mayor, annually elected, and a unicameral council. There are municipal water-works. Population, in 1900, 6125. Norwalk was settled in 1649 and incorporated as a town in 1651. It embraced what is now the cities of South Nor-

walk, chartered in 1870, and Norwalk. The latter was incorporated in 1836, as a borough, and was chartered as a city in 1893. On November 11, 1779, Norwalk was burned by a British and Hessian force under Generals Tryon and Garth. Consult: Selleck, *Norwalk* (Norwalk, 1896); and Byington, "Ancient and Modern Norwalk," in the *Connecticut Quarterly*, vol. i. (Hartford, 1895).

NORWALK. A city and the county-seat of Huron County, Ohio, 55 miles west by south of Cleveland; on the Lake Shore and Michigan Southern and the Wheeling and Lake Erie railroads (Map: Ohio, E 3). It is a city of fine residences, particularly on the main street, and has a handsome court house and jail. Norwalk is well situated for a commercial centre in an agricultural and stock-raising country; its extensive industrial interests are represented by piano works, iron and steel works, railroad shops, pickling works, manufactories of interior decorations, curtain poles, novelties, umbrellas, tobacco, etc., and by a printing and publishing house. The government is vested in a mayor, elected every two years, and a unicameral council. The water-works, with reservoirs having a capacity of 500,000,000 gallons and covering an area of about forty acres, are owned and operated by the municipality. Settled in 1817, Norwalk was incorporated first in 1828, and in 1881 received a city charter. Huron County is the westernmost of the ten counties in northern Ohio composing the 'Connecticut Reserve,' or 'Western Reserve,' part of which was granted to Revolutionary sufferers. Population, in 1890, 7195; in 1900, 7074.

NORWAY (AS. *Norwæg*, *Norþwæg*, Icel. *Noregr*, *Norvegr*, Norw., Dan., Swed. *Norge*, ML. *Norregia*, *Northwagia*, North Way). A long, narrow coast country of Europe on the North Atlantic, constituting with Sweden the Scandinavian Peninsula. The length of the coast around the outer belt of rocks is 1700 miles, the entire shore line, including the fjords and the large islands, being about 12,000 miles, long enough to stretch half around the globe. The country extends from latitude 57° 58' to 71° 11' N. Its width in the south is about 250 miles, in the northern half about 60 miles, and in Finmarken, the extreme north, a little greater. The area is 124,129 square miles—a little more than that of New Mexico. The northern coast is washed by the Arctic Ocean; Norwegian sealers sail every year as far north as it is open. On the south the Skagerrak, connecting the North Sea with the Cattegat, separates Norway from Jutland. Toward the east Norway has a land frontier 1500 miles long, being bordered by the Russian Government of Archangel for about 50 miles, by Finland for nearly 500 miles, and by Sweden for 950 miles. The eastern boundary extends most of the way in the midst of a belt of desolate plateau land through which the boundary with Russia was defined only in 1826 and with Sweden in 1751. At three places, at the head of the Gulf of Bothnia, the Trondhjem depression, and farther south, complete land connections have been made by means of railroads across the peninsula. Two-thirds of the people live in the south.

TOPOGRAPHY. The coasts are remarkable as a region of fjords. The shore line is everywhere broken by deep incisions of the sea into the rocky cliffs. Traces of the glacial period are found all over the land, and the fjords and islands fronting

them are ascribed to the work of glaciers. Norway as a whole is a rugged plateau, with deep-cut valleys, the whole surface greatly denuded, peaks and groups of peaks rising, here and there, above the general level of the more plain-like region of the east. In the west, near the sea, are very ancient mountains worn down and rounded by denudation, and chiefly composed of hard igneous rocks that have better withstood the destructive forces which leveled the eastern districts to a plain.

In the southeast and the middle north (mainly north of Trondhjem) is the woodland rising to an average height of from 300 to 1500 feet, with forest-clad hillsides from which Norway's lumber is derived. The highland begins in the southwest with a width of 60 miles, and a plateau height which soon reaches 3000 feet, merging finally into the wide waste through which the eastern boundary passes. In the extreme west geographers distinguish three mountain ranges—the Langfjeld in the south, the Dovrefjeld between the northern and southern districts, and the Kjölen between Norway and Sweden farther north.

HYDROGRAPHY. The height axis is not far from the west coast, and the western rivers therefore are short, although their volume of water is large on account of the heavy rainfall. The eastern rivers flow along fairly regular parallel valleys, which are open and flat in the mountains, but are cut deep through the plateau. A few of the eastern fluvial basins are large, that of the Glommen being 16,000 square miles, that of the Drammen 6600 square miles, and that of the Skien 4250 square miles, but the volume of water is comparatively small on account of the smaller rainfall. The slope is great and the rivers are filled with falls and rapids, which impart great beauty, but prevent navigation. The mountain highland and woodland are dotted with an enormous number of lakes, most of them narrow and long, due to the intense action of glaciers. It is supposed that in the great glacial period the inland ice must have extended even above the highest peaks. Most of the larger lakes are found in the long valleys—the largest of them, Mjøsen (140 square miles, 60 miles long, 1500 feet deep), Randsfjord, Spirilen, Kröderén, and others, lying at a height of about 400 feet above the sea just outside the border of the highland in the east country.

CLIMATE. Norway reaches 300 miles into the Arctic zone, and nearly a third of the country is in the domain of the midnight sun and winter darkness. The summer day is long and bright, but the winter day is short and dark. At Christiania, in the far south, the sun is above the horizon on the shortest day less than six hours. The west coast is warmer than the interior because it has the full effect of the westerly winds, whose temperature is modified by blowing from the temperate waters of the Atlantic. The fjords therefore do not freeze, but are navigable the year around. The land, rising from the coast into mountain tops and plateaus, in places rises into regions of perpetual snow where glaciers descend into the valleys. The line of perpetual snow, at the parallel of 62° N., is between 4500 and 5000 feet above the sea; at 66° 30' the snow line falls to 3900 feet, and at 70° to about 3000 feet.

The climate varies in different parts of the country. Southeast Norway, limited on the north by the Dovrefjeld, has a mean annual temperature varying from 44° to 31° F. July is the warmest month, with a mean temperature of 61° at Christiania. The winter is most severe in the heart of the country. At Christiania the mean winter temperature is 25°. The temperature of West Norway is fairly uniform, the mean annual temperature being highest (44° to 45°) at the extreme western ends of the land. The annual rainfall is greatest along the western coast, ranging from 50 to over 80 inches. On the southeast coast, near Grimstad, it is 48 inches, while on the Dovrefjeld it is only 12 inches. Snow is less frequent in the west than in the east on account of the milder winter temperature. The country north of the Dovrefjeld is colder than in the south, but the climate of the coast region is also modified by oceanic influences. The most varied shades of continental and maritime climates are thus represented in Norway. The inland districts of Southeast Norway and Finnmarken, with their severe winters and relatively high summer temperature, their gentle breezes and small rainfall, are examples of typical inland climate. The whole coast line, with mild winters, cool summers, abundant rainfall, and unsettled weather, is an example of typical maritime climate. On the whole, the climatic conditions are favorable to the development of a strong, healthy, energetic people.

FLORA. The richest vegetation is found in the southeast around Christiania Fiord and the large lakes. Considering its northerly position, Norway has a luxuriant vegetation. About 1500 species of phanerogams alone grow wild. In the southeast conifers form thick forests from sea-level to 3000 feet. Up to about 1600 feet above the sea a luxuriant growth of oak, ash, lime, maple, elm, and lowland birch is found, secondary to the conifers, but giving its characteristic stamp to the lowland flora. Above the limit of conifers is the birch zone, reaching 3500 feet above the sea, where the true mountain plants begin to be prominent. Above the birch limit the willow and the lichen zones are distinguished. In the willow zone there are no trees—only a dense growth of low bushes. Reindeer moss predominates in the lichen zone. The extreme coast region is destitute of forest, and also of some continental plants found inland, but is especially rich in mosses. The arable soil is found in narrow strips of deep valleys and around fiords and lakes. Large continuous tracts fit for cultivation do not exist, and only 1-140th of the total surface is in grain fields.

FAUNA. The animal life is that of the rest of North Europe, with relics, chiefly in the north, of Arctic elements such as the mountain or Arctic fox, the ptarmigan, the snow bunting, and various insects. With its long coast line Norway is richer in species of fish than most northern lands, more than 200 species being found. There are a number of Arctic contributions, including the Greenland shark, which is fished for its liver. Very numerous are fishes which belong to the north or general European fauna, including most of the food fishes, such as cod, haddock, coalfish, pollack, torsk, herring, sprat, and mackerel. The salmon is caught along the coast and in the rivers, where it comes to spawn. Trout and red char are the most widely dis-

tributed fresh-water fish. Of the ten species of reptiles and amphibia, the lizard and the frog are found everywhere, but the viper has its northern limit at the Polar circle. The birds number 280 species, of which 190 breed in the country. Most of them are birds of passage, as the falcon, geese, and ducks. The mild climate of the south and west coasts induces the starling, blackbird, woodcock, duck, swan, etc., to winter there. Along the west and northern coasts are numerous colonies of swimming birds. The birds of the lowlands are similar to those of Europe in general. There are 67 mammals. The hedgehog is found in the south, the lynx in unfrequented forests, and the glutton, a great enemy of the reindeer, among the mountains of the north, where the reindeer grazes. Wolves, formerly numerous, have nearly disappeared, except in North Norway. Bears are gradually disappearing, and the commonest beast of prey is the fox among the mountains. The common seal and the gray seal breed on the Atlantic islands, and all the Arctic seals, and even the walrus, sometimes appear on the north coast. The lemming lives in the mountain wastes and sometimes overruns the lowlands, damaging crops. A few beavers remain, and the mountain hare, which turns white in winter, is found all over the country. The ruminants are represented only by the red deer, the elk, and the reindeer among wild animals. The wild reindeer is decreasing on account of over-hunting, but many herds of tame reindeer are kept in the north and even among the mountain wastes of the south that lie too high for general grazing.

GEOLOGY AND MINING. Archæan rocks have a wide extension in Norway, particularly through the mountain regions of the west and in the districts from Lake Mjøsen southward. Gneiss and granitic gneiss are the prevailing rocks in these regions. During Cambrian and Silurian time the open sea extended over the greater part of Norway, and on its bottom lime, mud, sand, and gravel were laid down, forming a series of strata rich in fossils and very thick. Cambrian and Silurian rocks are thus widely represented, particularly east of the mountains and north of Lake Mjøsen, and also among the northern mountains behind the coastal areas of igneous rocks. A belt of Post-Silurian and Cambrian rocks extends from Lake Mjøsen southward through the Christiania region to the south coast, forming the subsoil of that beautiful and undulating country. Over large areas of the ancient rocks are spread the deposits of the Ice Age to no great depth. Raised beaches along the outer parts of many fiords are proof of the former lower position of the land. The mining industry is not important, for Norwegian ores are not rich nor large in extent. The Kongenberg silver mines, owned by the State, yielded 898 tons of silver between 1624 and 1898. The Røros copper mines, owned by a joint stock company, yielded 73,000 tons of copper between 1647 and 1897. Iron ores occur in many places, but little is mined, and coal does not occur except on the remote island of Andø. At the end of 1900 there were about 40 mining establishments, employing 3017 workpeople, and 6 smelters, with 302 laborers. The chief mineral products of 1900 were silver, worth \$88,440; copper ore, \$679,487; pyrites, \$630,872; and iron ore,

COPYRIGHT, 1905, BY DODD, MEAD & CO.

\$35,644. Fine marble, building stone, roofing slate, soapstone, and millstones are produced in large quantities and are important exports.

FISHERIES. Fishing is among the oldest of the country's industries. The value of the large fisheries has averaged for 31 years \$5,796,400 a year. This does not include the catch (daily fishing, as the Norwegians call it) which supplies the wants of the home population. The value of all the fisheries, including the Arctic fisheries and various extra sources of profit, such as oil and fish guano, is about \$13,400,000 a year. The cod is the largest fishery, the number of persons engaged in it in 1900 being 82,098, and the value of the catch \$3,636,492. The largest centre of the industry is the Lofoten Islands, where, in the first few months of the year, about 40,000 men are engaged in fishing or in preparing the catch for market. The average per man for the whole of the fishing is from 900 to 1000 cod. The fish are sold partly to traders on the islands who have warehouses with salting and storing rooms, and partly to merchant vessels, which carry their purchases to other ports. The herring fisheries, next to the cod in importance, are carried on all along the coast, the summer fisheries employing over 20,000 men, and the value of the product being usually over \$2,400,000. The catch in recent years has not been so large as formerly, but is now improving. The mackerel is rare north of Trondhjem Fiord, and is fished chiefly in the Skagerrak and the fiords off it. The industry in 1900 employed 2741 men, the product being worth \$152,492. The salmon, sea trout, lobsters, and oysters (small yield) also figure in the total product of the large fisheries, the total value in 1899 having been \$6,510,256. The mackerel is also caught in the North Sea, and the Arctic fisheries engage every season about 2000 men who sail over the Arctic Sea from Greenland and Jan Mayen Island in the west to Spitzbergen and Finmarken in the east, for sealskins and oil, whale oil, and bearskins.

AGRICULTURE. Of the total area, 59 per cent. is bare mountain, 21 per cent. woodland, and only 10 per cent. is in pastures, hay lands, and fields. In the southeast cultivated plants and fruits ripen in the open air, but in the north and on the higher tracts there is little or no agriculture. Crop and cattle raising are usually carried on together. Oats is the chief grain, but none of the cereals suffices for the needs of the country. Barley and rye are grown much farther north than oats, but wheat is rarely found north of the Trondhjem Fiord. The area annually sown to wheat is about 10,000 acres, with a yield of about 255,000 bushels. Rye is the great bread cereal, its cultivation extending to the 70th parallel, the area annually sown being about 34,000 acres, and the yield about 900,000 bushels. Among root crops only potatoes are cultivated to a large extent, and they are one of the chief foods. The average production is about 23,000,000 bushels. The yield of the different kinds of grain is large compared with that of most European countries, due to careful cultivation and heavy manuring.

LIVE STOCK. Norway has only about one-third of the cattle of Scandinavia, but the pastures give adequate grazing for most of the sheep. In 1900 there were in the country 172,999 horses,

950,201 cattle, 998,819 sheep, 214,594 goats, 165,348 swine, and 93,576 reindeer.

Of the two types of horses, the small flord horse is an excellent working animal in the mountain districts, where good roads are lacking. The larger Gudbrandsdal is quick and strong as a farm and carriage horse. The cattle of several different breeds are small, but good milkers. They often seek their food over large areas of sparse pastures. Attempts to improve them by an admixture of foreign blood have not been very successful. Most of the butter and cheese is made in coöperative dairies with the best equipment, and brings the highest price in the British market. Norwegian sheep are small, slender, and fine woolled. They have been crossed with foreign breeds to their advantage. The gross return of the live stock industry annually averages about \$37,520,000, which, added to the average return of \$18,760,000 a year from the farm crops, gives a gross income from Norwegian husbandry of over \$56,000,000 on an average. The buildings on Norwegian farms are comparatively expensive on account of the severity of the winter. Domestic animals require warm barns, and everything, including hay, must be housed. The number of farms in 1890 was 236,286.

FOREST INDUSTRIES. Lumbering has always been one of the greatest industries. The large forests lie far from the inhabited districts as a rule, and the timber-cutters and log-drivers live in huts, most of them being strong and hardy single men. Three-fourths of the forests are pine lands, but the Norway pines and spruces convenient to Christiania and other shipping points have been depleted in many places so that the more northern forests in Sweden are now the larger source of Scandinavian lumber. Norway's forest products, however, form about one-third of the country's total exports. The value of the unwrought or partly wrought timber exported in 1901 was \$9,539,888, and of wrought timber (mostly wood pulp) \$6,436,448.

OTHER INDUSTRIES. About 50,000 persons are engaged in the manufacturing and other industries outside of those mentioned above. The production of lumber and wooden ware is the oldest and largest branch, employing in 1895 12,073 work people. There are many saw and planing mills, chiefly along the rivers. The most important machine shops are in Christiania. Iron ships are built and there are carriage and car works. In machine production Norway has yet much to learn from other countries. The textile industries, spinning and weaving mills, jersey factories and roperies, employ about 9000 persons, and number 64 establishments, most of them situated in the outskirts of the towns. Paper-making derives its importance from the large resources of wood pulp. Small tanneries and flour mills are scattered all over the country. Breweries, tobacco and tinning works, are chiefly in the larger towns, and particularly in Christiania. Potteries, china factories, iron foundries, nail-rolling and wire mills, have a considerable output. Only about 2000 persons are employed in making articles of attire. As the country is deficient in industrial development, the imports of manufactures are large.

COMMERCE. The growth and average annual amount of Norway's trade may be seen from the following table:

	1881-85	1891-95	1901
Imports.....	\$40,500,000	\$59,500,000	\$76,900,000
Exports.....	28,500,000	35,000,000	41,400,000

The aggregate foreign commerce since the middle of the nineteenth century has more than quadrupled. The imports largely exceed the exports, but this difference is covered to a great extent by the profits from the shipping trade, as Norway is a great carrier of freight for foreign countries. Articles of food and drink are the largest imports. Nearly half the value of the imports is represented by cereals, rye being the chief item, with barley, wheat flour, rye flour, and wheat following. Groceries, particularly sugar and coffee, are large imports. Bacon and other meats are brought chiefly from the United States. Cotton and woolen goods and yarn are the chief textile purchases. Among the imports of raw material are coal, hides and skins, iron and steel, cotton, wool and hemp. The country buys over 1,250,000 tons of coal every year. Oils, particularly kerosene, hampseed, and linseed, amount to about \$1,500,000 a year. Steam-engines, locomotives, metal goods, and vessels are also large imports. Timber and fishery products are the most important exports. About one-fourth of the timber is sent abroad as deals and boards. Some 350,000 tons of wood pulp are annually sold. The increased sales of the products of agriculture and cattle-raising, which have quadrupled since 1871-75, are especially due to exports of butter and condensed milk. Among other important exports are packing paper, ships, ice, dressed stone, iron and steel nails, and metal and ores. The United Kingdom and Germany are most important in Norwegian commerce, the United Kingdom commanding about one-third and Germany one-fourth of the entire trade, while Sweden has less than a tenth. The sales to the United States are very small, as the latter country produces in great abundance most of the export commodities of Norway; but Norway buys from this country cotton, wheat, provisions, tools, machinery, fertilizers, locomotives, and leather goods to the value of several million dollars a year. The foreign commerce is carried on chiefly through the ports of Christiania, Bergen, and Trondhjem, the timber-trading towns of Fredrikstad and Drammen being also especially important. Christiansand is widely known for its export of salted and dried fish.

TRANSPORTATION AND COMMUNICATIONS. The Norwegians are a race of sailors. Their merchant marine is the fourth largest in the world, and in proportion to population it heads the list. While the natural commerce is comparatively small, Norwegian vessels and sailors are conspicuous in the sea carriage of freight for foreign nations. A considerable number of their vessels are engaged in the fruit trade between the United States and Latin America. In 1902 the mercantile marine included 5445 sailing vessels (935,947 tons) and 1223 steamers (531,142 tons), or a total of 6668 vessels with a tonnage of 1,467,089. The total length of railroads in 1901 was 1308 miles, of which the State railroads had a mileage of 1168.

BANKS. The right to issue paper money is reserved to the Bank of Norway (Norges Bank), a joint stock bank owned in part by the State. The bank has charge of the money transactions

of the State, and does business as a loan, circulation, discount, and deposit institution. The head office is at Christiania, and it has twelve branch offices in the most important towns. The balance sheets for 1901 showed total assets of \$26,578,926. The Mortgage Bank of the Kingdom of Norway, "Kongeriget Norges Hypothekbank," makes loans on real estate. The capital of the bank is partly supplied by the State, and amounted in 1901 to \$4,690,000; the loans on mortgage at the end of 1901, \$36,159,560, of which about one-fourth had been granted on town and three-fourths on country property; the total amount of bonds issued was \$34,062,671. There were 78 private joint stock banks, with a paid up capital of \$11,373,492. The number of chartered savings banks, all controlled by the Ministry of Finance, was 421, with 695,524 depositors and \$86,292,423 deposits.

GOVERNMENT. Norway, though united to Sweden since 1815, under the same King, retains its own Government with a separate Ministry and Legislature. The law of succession to the crown is the same in both countries, and commissioners appointed by the two Parliaments regulate the questions touching the transmission of the crown. Affairs common to the two governments are attended to by a Council of State composed of both Swedes and Norwegians. The form of government in Norway is fixed by the Constitution or fundamental law of May 17, 1814, which has undergone several subsequent modifications. The Norwegian State is a constitutional monarchy with the parliamentary or responsible system of government. The legislative power is vested in a Parliament or Storting, which, upon assembling, divides itself for legislative purposes into two chambers, the Odelsting and the Lagthing. The former consists of three-fourths of the whole number of members chosen to the Parliament. The members include representatives from the cities and representatives from the country, all chosen for a period of three years and renewed integrally. All male citizens twenty-five years of age who have resided in the State for a period of five years are qualified to vote for members of the Storting unless disqualified for special causes. To be eligible to membership in the Storting one must be a male citizen thirty years of age, and must have resided in Norway for a period of ten years. Certain high State functionaries are disqualified. The elections are indirect and in the second degree. A certain number of primary electors in the country choose one secondary elector; the secondary electors then assemble in the chief towns of the electoral district and choose a certain number from their own body to serve as representatives in the Storting. The Storting meets annually, but cannot remain in session for a longer period than three months without the authorization of the King. The King may call extraordinary sessions of the Storting and dissolve it, but he does not have power to dissolve the ordinary sessions and order new elections. The members receive a compensation of about \$3 per day during the session.

After the separation of the Storting into two chambers, each meets separately, chooses its own officers, and is the judge of the election and qualifications of its members. Bills are first presented to the Odelsting by its own members or by the Government, and after passage are sent to the Lagthing, which must either accept or re-

ject them *in toto*. In case of a deadlock between the two chambers they come together in united session and deliberate and vote as a single assembly. The chief powers of the Storting are to enact laws, impose taxes, raise loans, supervise the finances, vote appropriations, and approve treaties concluded with foreign powers. The Lagthing has the exclusive right of choosing the justices of the High Court, while to the Odelsting belongs the right to inspect the public accounts and to prefer impeachments against public officials, including members of the Storting. The members of the Lagthing, together with the justices of the Supreme Court, form a court (Rigset) for the trial of ministers, members of the Storting, and justices of the Supreme Court. To the King belongs the right of sanctioning laws passed by the Storting. If, however, he withholds his sanction and the law is passed a third time by the Storting, it becomes valid without the royal approval. The King is commander of the army and navy, may declare defensive war, make treaties, levy troops, etc. He is declared to be inviolable and irresponsible. He exercises his authority through a Council of State composed of two Ministers and at least seven Councilors, appointed by himself from among Norwegians. One of the Ministers, together with two of the Councilors (who change annually), form a 'delegation,' which resides permanently at Stockholm near the King. The King can take no official action without consulting the Council of State or that part of the Norwegian Government which has its seat at Christiania. The Ministers and Councilors preside over the departments of administration and have access to the Storting, where they are allowed to take part in the deliberations, but with no right to vote. The departments are as follows: Worship and Education; Justice; Interior; Public Works; Finance and Customs; Defense; Public Accounts.

The judicial system consists in the first place of a Supreme Court (Höiesteret), composed of a president and at least six other justices, elected by the Lagthing, and having a territorial jurisdiction embracing the whole Kingdom. There are also three Superior Courts (Steffesverretter), each consisting of a bench of three justices, one of whom bears the title of Chief Justice. For the administration of civil justice Norway is divided into 111 districts, each with an inferior court. There is also a court of mediation, so called, in each town and district, composed of two laymen popularly elected and before whom, as a rule, civil cases must first be brought. According to the new code of criminal procedure, adopted in 1887, all criminal cases must be tried before a jury court (Lagmandsret) consisting of three judges and ten jurors, or before the Meddomsret, a tribunal consisting of one professional judge and two lay assistants, summoned for each case. The former has jurisdiction of the more important offenses, while the latter is a court of first instance for the trial of misdemeanors. For the purposes of local government, Norway is divided into 20 districts, in each of which is an executive officer called an *amtmana*. These districts embrace the two cities of Christiania and Bergen and 18 counties (*aemter*). Smaller administrative divisions are the communes and wards. Each commune has a representative assembly (its size

varying according to the population of the commune), and a smaller council, chosen by the representatives from their own body. They also elect triennially a chairman. All the chairmen of an *amt* form with the *amtmana* a sort of county diet, which meets annually under the presidency of the *amtmana* to fix the *amt* budget. The members of the local governing bodies are chosen by an electorate more narrow than that which chooses the members of the Storting.

FINANCE. The total revenue in the year 1902-03 was \$27,403,000. A little over a third of it is derived from the customs, and less than a tenth from the railroads. The other sources of income include the excise tax, stamps, income tax, post office, State telegraphs, State mines, and other State property. The total debt in 1901 was \$61,300,756. Gold is the standard of value. The crown (26 4-5 cents) is the unit of coinage. The metric system of weights and measures is obligatory.

ARMY AND NAVY. See the articles **ARMIES** and **NAVIES**. The six strongest fortresses are Oskarsborg, Tönsberg, Bergen, Fredriksten, Ogdnes, Christiansand.

POPULATION. By the census of 1900 the population was 2,239,880, or 18 to the square mile. Norway is thus the most thinly populated country in Europe. About two-thirds of the entire population live upon the coast and along the fjords; about a fourth in the interior lowland districts; the remainder belong to the mountain districts. Three-fourths of the inhabitants dwell in the rural districts. Nearly all the sixty-one towns in Norway are small. The population of Christiania (the capital) and Bergen together is about half the town population of the country. A small proportion of the inhabitants are of foreign birth.

The list of the political districts, with areas and populations, is as follows:

DISTRICTS	Area, square miles	Population Dec. 3, 1900
Christiania (town).....	6	227,626
Akershus.....	2,017	116,228
Smaalenene.....	1,600	136,886
Hedemarken.....	10,600	126,182
Kristians.....	9,785	116,280
Buskerud.....	5,721	112,676
Jarlsberg and Laurvik.....	896	104,554
Bratsberg.....	5,865	99,062
Nedene.....	3,610	79,935
Lister and Mandal.....	2,805	81,567
Stavanger.....	3,532	127,592
Søndre Bergenhus.....	6,026	135,752
Bergen (town).....	5	72,251
Nordre Bergenhus.....	7,136	89,041
Romdal.....	5,788	136,137
Søndre Trondhjem.....	7,185	135,382
Nordre Trondhjem.....	8,696	83,433
Nordland.....	14,804	152,144
Troms.....	10,134	74,362
Finnmarken.....	17,918	32,800
Total.....	124,129	2,239,880

EMIGRATION. In the nineteenth century Norway lost by emigration to the United States a comparatively larger part of its population than any other country in Europe excepting Ireland. Most of them made their new homes in the Northwestern United States. Emigration has greatly fallen off in the past few years, and amounted to only 12,488 in 1901.

EDUCATION. The Norwegian primary school has a seven years' course adapted for children between seven and fourteen years of age. Every

child that does not receive an education equivalent to the primary course by its fifteenth year may be compelled to attend these elementary schools, which in 1898 numbered 5971, with 259,460 pupils in the country, and 73,313 in the towns. Secondary schools numbering 86, of which 30 are private, give a higher course of instruction, and have about 16,000 pupils. The Royal Frederick University in Christiania has 63 professors and 1400 students.

RELIGION. The Evangelical Lutheran creed is the State religion, and the Church is called the Norwegian Established Church, most of the inhabitants being members. All other religions are tolerated. Norway is divided into 6 bishoprics, and each diocese into deaneries, which are again subdivided into livings at present numbering 478. The total number of parishes is 956. The dissenters in 1900 numbered 52,680, including 1969 Roman Catholics and 10,286 Methodists.

The poor are provided for by local taxes, though the counties and the State assist. The number of persons receiving relief of any kind in 1899 was 80,730.

ETHNOLOGY. Since Neolithic times Norway has been mainly inhabited by tall, blonde longheads, of Teutonic stock, who are believed to have come from the Caucasian steppes during the prehistoric migrations. Because of the great ice cap which lingered on the mountains, Norway was peopled much later than Sweden, which shows Paleolithic inhabitation, while the former has revealed only the Neolithic. There were three land bridges by which man may have come to the Scandinavian peninsula, one on the west joining the British Isles to Norway; the second from Rügen in North Germany to Scania in Sweden; and a third much later bridge from Finland to East Sweden. By the middle bridge Sweden and Norway received the red deer and the Teutonic longhead population, which is almost pure in the former country. Whatever Finnic elements are present may have come by the Bothnia bridge. On the west there came a dark, short type of probably Round Barrow or Pictish origin. It would seem that these people brought the Shetland pony. The longheads coming in from Sweden around the southwest coast lowlands occupied the interior of the country after the melting away of the ice cap. This region was never touched by that tremendous wave of migration of short, dark longheads called 'Mediterraneans' by Sergi, coming, it is conjectured, originally from North Africa. Thus there has been forming here for a long period from these light and dark elements a virile race in an environment whose stress was a spur to the education of many qualities for which the Norwegians have excelled since they came in the purview of history.

The Norwegians prefer a country life, but little of the modern movement toward cities being noticed until recently. They are of tall stature (5 ft. 8 in.), with strong, well-knit frames, and good muscular development. Fair skin, blue eyes, and light flaxen hair characterize the bulk of the population, but the dark type is often recognized. Among the children flaxen hair is almost universal, but with development the hair, eyes, and skin become darker in a majority of cases. As a people the Norwe-

gians are remarkably hardy and show a preference for athletic sports which require great endurance. For this reason they are typical explorers. In character they are frank, yet cautious and reserved, honest, and religious. While modified Danish is the literary language, the old Norse survives in a few districts, as it does in Iceland. Since the peasants speak various dialects of Old Norse, and many of the educated consider the presence of the Danish language an anomaly, efforts to revive Norse have been zealously prosecuted for many years.

HISTORY. The early history of Norway is preserved only in the legendary sagas. The most recent archaeological researches show that the Scandinavian people were probably the autochthonous inhabitants of the peninsula. The historical period of Norway reaches no further back than the ninth century. The petty tribal kingdoms which existed here as in all northern countries were united under Harald Haarfagr or Fairhair (died c.933), who in the last third of that century established the seat of government at Trondhjem in the north. At this time the Danes and Norwegians (see NORMANS) were the terror of Europe through their plundering expeditions and invasions.

The introduction of Christianity, the result of the intercourse which the Norwegians had with the more civilized parts of Europe through their maritime expeditions, was gradually effected in the hundred years that followed the death of Harald Haarfagr. Haakon the Good, son of Harald Haarfagr, attempted vainly to establish it; but this result was brought about by Olaf Trygvasson (995-1000) and Olaf the Saint (c.1015-1030), wild northern missionaries who bore the cross in one hand and the sword in the other. Olaf the Saint zealously prosecuted the conversion of his countrymen and raised himself to supreme power in the land by the subjection of the small kings or chieftains who in the times of heathenism had subdivided the Kingdom among them. In 1028 Olaf was driven out by Canute the Great of Denmark, and, having attempted to recover his throne, was defeated and slain in 1030. On the death of Canute in 1035, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, Norway continued to be governed by native kings. Of these the most noteworthy were Sverre Sigurdson (1184-1202), a statesman of considerable ability who was put in power by the nationalist democrat party, who after years of bitter strife had overcome the party of the nobles and clergy, and Haakon the Old (1217-63), in whose reign independent Norway reached the height of its prosperity. During these centuries the Norse adventurers had established permanent colonies in Iceland and Greenland, and for a time the Orkney and Shetland islands and the Hebrides were in the possession of the Norwegian kings, whose last inroad into Scotland was repelled in 1263. The thirteenth century saw the beginning of written Norse literature and law. The death of Haakon V. without male heirs, in 1319, threw the election of a new king into the hands of the national assembly, who made choice of Magnus of Sweden, surnamed Smek, the son of Haakon's daughter. He was in turn succeeded by his son, Haakon, and the latter's son, Olaf, after having been elected King of Denmark in 1376, became ruler of both Scandinavian king-

doms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother, Queen Margaret (q.v.), the only child of Valdemar IV. of Denmark, died without heirs in 1387. The ambitious and capable Margaret succeeded to the thrones of Denmark and Norway, and in 1389 she became mistress also of Sweden, and the three kingdoms were bound together by the Union of Calmar in 1397.

From the Union of Calmar till 1814 Norway continued united with Denmark; but while it shared in the general fortunes of the latter State, it retained its own constitutional mode of government, and exercised its right of electing the sovereign until, like the sister kingdom, it agreed of its own free will to relinquish this privilege in favor of hereditary succession to the throne. (See DENMARK.) Norway declined in prosperity and energy after the fourteenth century, in the middle of which the Black Death swept over it, leaving the land exhausted and partially depopulated. Oppressed by Denmark, her colonies and her commerce lost, there seemed to be little left of the national life. The Napoleonic wars severed the union which had existed for more than 400 years; for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the triumph of the Allies, to purchase peace by abandoning its sovereignty over Norway. Crippled in her resources and also bankrupt, she saw herself constrained to sign the Treaty of Kiel in 1814, by which it was stipulated that she should cede Norway to Sweden, receiving by way of indemnity Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg. The Norwegians refused to admit the validity of the Treaty of Kiel, and a National Diet, assembled at Eidsvold, tendered the crown of Norway, as an independent kingdom, to the Danish Crown Prince Christian Frederick (the future Christian VIII.). This Assembly drew up a constitution based on the French Constitution of 1791. These measures found, however, neither supporters nor sympathizers among the other nations; and with the sanction of the Great Powers, Bernadotte, Crown Prince of Sweden, led an army into Norway, and after taking Frederikstad and Frederikshald, threatened Christiania. Denmark being unable to support the cause of Prince Christian, and Norway being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians were glad to accept the proposals made to them by the Swedish King for a union with Sweden on the understanding that they should retain the newly promulgated Constitution, and enjoy full liberty and independence within their own boundaries. These conditions were agreed to, and strictly maintained; a few unimportant alterations in the Constitution, necessitated by the altered conditions of the new union, being the only changes introduced in the machinery of government.

Norway has firmly resisted every attempt on the part of the Swedish monarchs to infringe upon the constitutional prerogatives of the nation, and the feeling of national autonomy has been intensified by a striking difference between the democratic population of Norway and the more conservative population of Sweden, where the aristocracy still exercises considerable influence on the Government. The national movement,

which continued throughout the nineteenth century in spite of repeated attempts on the part of the sovereign to mediate between the Norwegian and Swedish parliaments, had as its ultimate aim the reduction of the bond between the two kingdoms to a mere personal union. Conservative, Liberal, and Radical ministries succeeded each other in rapid alternation, but while the two former parties were too weak to effect any permanent arrangement, the Radicals, who were as a rule in a decided majority, failed in their policy against the resolute resistance of the Swedish Landsting. The Norwegian Parliament, the Storting, for some time before 1890, sought to enforce its policy by refusing to vote adequate supplies for the defense of the united kingdoms, and attempted to organize the military strength of the nation in the form of a militia and volunteer corps, on whose sympathy the Storting might depend. After 1890 the policy of the Radical Party, which in secret was aiming at complete separation from Sweden, crystallized in the demand for a special Ministry of Foreign Affairs for Norway as well as a distinct diplomatic and consular service. This, however, the sovereign refused to concede. A temporary truce was concluded in 1895, when a new law regulating the commercial relations of the two countries went into effect, and a joint committee composed of Swedish and Norwegian representatives was intrusted with the execution of its provisions; but in the election of 1897 the Radical Party gained an overwhelming victory, and the conflict was renewed with increased ardor. In 1899 King Oscar II. finally gave his consent to a law removing the emblem of Sweden from the flag of Norway, which thus resumed the use of its old ensign. A bill, however, tending toward the final establishment of a separate consular service for Norway failed of the royal approval in 1900. In 1898 a law providing for direct election to the Storting by universal manhood suffrage went into effect. This was supplemented by a law in 1901 dealing with communal electors, by which the suffrage was granted to all adult males and such women as paid a tax on an income of more than 300 kroner.

BIBLIOGRAPHY. In addition to the numerous official publications, all printed in the Norwegian language, *Norway*, printed in English by the Government in 1900 for the Paris Exposition, is one of the fullest and most accurate sources of information. Other works are: Forbes, *Norway and Its Glaciers* (London, 1853); Enault, *La Norvège* (Paris, 1857); Bowden, *Norway; Its People, Products, and Institutions* (London, 1867); De Mombynes, *Constitutions européennes* (Paris, 1881); Du Chaillu, *The Land of the Midnight Sun* (New York, 1882); Ballou, *Due North, or Glimpses of Scandinavia and Russia* (Boston, 1887); Collet, *Bird Life in Arctic Norway* (London, 1894); Bradshaw, *Norway: Its Fjords, Fjelds, and Fosses* (ib., 1896); Chapman, *Wild Norway* (ib., 1897); Seignobos, *Histoire politique de l'Europe contemporaine* (Paris, 1897); Hyne, *Through Arctic Lapland* (London, 1899); Lee, *Peaks and Pines* (ib., 1899); Ruge, *Norvegen* (Leipzig, 1899); Quillardet, *Suédais et Norvégiens chez eux* (Paris, 1899); Gandolphe, *La vie et l'art des Scandinaves* (ib., 1899); Konow and Fischer, *Norway* (Christiania, 1900); Spender, *Two Winters in Norway* (London, 1902).

(Paris, 1899); Barth, *Crania antiqua*, etc. (Christiania, 1896); S. O. Müller, *Nordische Altertumskunde* (Strassburg, 1897); Undset, "Aus der jüngeren Eisenzeit in Norwegen, 800-1000 A.D." in *Archiv für Anthropologie*, vol. xx. (Brunswick, 1891); and for the history: Dunham, *History of Denmark, Sweden, and Norway* (London, 1839-40); Overland, *Illustreret Norges Historie* (Christiania, 1885-94); Keary, *Norway and the Norwegians* (New York, 1892); Laing (trans.), *The Sagas of the Kings of Norway* (London, 1889); Fabricius, *Minder fra Nordens Historie* (Odense, 1898); Munch, *Det Norske Folke Historie* (Christiania, 1852-63); Nielsen, *Norges Historie efter 1814* (ib., 1882); Geffroy, *Histoire des états scandinaves* (Paris, 1851); Le Bas, *Suède et Norvège* (ib., 1841); Carlyle, *The Early Kings of Norway* (London, 1875); Boyesen, *The Story of Norway* (ib., 1886); Otté, *Scandinavian History* (ib., 1875); Sörensen, *Norway* (New York, 1901).

NORWEGIAN LANGUAGE. The language which, together with Icelandic and Faroese, forms the West Norse division of the Scandinavian group. Like the other members of this group division, the Norwegian is more homogeneous than either Danish or Swedish. Chiefly as a result of phonetic changes its inflections are less original than those of Icelandic, although it retains the three genders. Its common Scandinavian characteristics are the suffixed definite article, the medio-passive, and the neuter-ending -t. Norwegian was divided at an early period into two main dialect-groups, the Eastern, including the Gudbrandsdal and the Drontheim, which resembles the Swedish, and the Western, represented by Hardanger, Voss, Sogn, and Setersdal, which approaches the Icelandic. A subdivision of the West Norwegian, spoken along the coast, resembles the Danish.

The early period of the language is similar to that of Icelandic (q.v.). During the period from 1350 to 1530 Norwegian was strongly influenced first by the Swedish and later by the Danish. As a result of the Union of Calmar (1397), by which Norwegian independence was lost, Danish was substituted for the native language for purposes of literature and public business, although the Norwegian survived in the country districts in various dialects, and was used for social intercourse and the composition of folk tales and ballads. The modern standard language shows many divergencies both in forms, in vocabulary, and in syntax from the Danish of Denmark, and is generally distinguished from it as Dano-Norwegian. By the Norwegians themselves the dialects and the standard language are alike called Norse, but this usage is not recognized by scholars. During the last fifty years efforts have been made to emphasize the Norwegian character of the language by adapting its orthography to local pronunciation, and by introducing forms from the native speech. Dano-Norwegian has been described as Danish with a Swedish pronunciation.

A peculiar language movement in Norway is attracting attention throughout Scandinavia. It

is no less than the creation and spread of a new form of Scandinavian speech, called by its originator, Ivar Aasen (q.v.), *Landsmaal* (national tongue). It is a written language, not used for social intercourse, and is based upon the existing dialects of Norway. At first this artificial language was used exclusively in poetry, but in 1858 the first newspaper in the *Landsmaal* appeared, and since then it has spread rapidly. In 1868 a society for the propagation of the new idea was established, branches of which now exist all over Norway. A number of acts have been passed by the Parliament in favor of the *Landsmaal*, among which may be mentioned that founding a chair in that subject at the University of Christiania. At present all acts of Parliament are published both in Dano-Norwegian and the *Landsmaal*. The principal literary supporter of the movement is the novelist Arne Garborg. Consult: Sargent, *Grammar of the Dano-Norwegian Language* (Oxford, 1892); Groth, *Danish and Dano-Norwegian Grammar* (Boston, 1894); Poestion, *Lehrbuch der norwegischen Sprache* (2d ed., Vienna, 1900); Noreen, *Altisländische und altnorwegische Grammatik* (2d ed., Halle, 1892); Aasen, *Norsk Grammatik* (Christiania, 1864), and *Norsk Ordbog*, with a supplement by Ross (ib., 1872-90); Larsen, *Översigt over de norske Bygdemål* (ib., 1898); Larsen, *Dictionary of the Dano-Norwegian and English Languages* (3d ed., Copenhagen, 1897); Brynildsen, *Dictionary of the English and Dano-Norwegian Languages* (ib., 1900—); Falk and Torp, *Etymologisk Ordbog over det norske og det danske Sprog* (Christiania, 1901—).

NORWEGIAN LITERATURE. Norwegian literature is commonly considered to have begun with the separation of Norway from Denmark and the adoption of the Norwegian Constitution in 1814. The history of literature in Norway, however, reaches back a thousand years before this time to Bragi (c.800), the first skald who is historically known to have composed poetry in the Old Norse language. His principal poem is the *Ragnarsdrapa*, which owes its preservation, in common with much of the skaldic poetry of old Norway, to the Icelander Snorri Sturluson, who incorporated it in his *Snorra Edda*.

There are a number of other poets in this and the succeeding period in Norway. After Bragi, the next in importance is Thjodolf of Hvin (c.855-930), whose principal poem is the *Haustlöng*, also contained in the *Snorra Edda*. Besides this poetry by known authors, most of the anonymous poems of the *Elder Edda*, composed, it is thought, between 875 and 1025, are doubtless ultimately of Norwegian origin. To the Old Norse prose literature of the thirteenth century Norway also made important contributions. At the head of these works stands the *Thidrekssaga*, the story of Dietrich of Bern, written about 1250 by an unknown author, and extremely valuable as a storehouse of Germanic legend. The *Karlamagnussaga*, the story of Charlemagne, from this same century, and the narrative of Barlaam and Josaphat, *Barlaamsaga ok Josaphats*, are also by Norwegian authors. There are in addition to these several old law codes of value as historical material, and the unique dialogue between father and son, the *Konungskuggsja*, or *Speculum regale*, written in the reign of Sverre (1184-1202), and possibly by the King himself.

After the accession of Olaf, the son of Margareta, in 1380, Norwegian history for four centuries becomes Danish history. Under Danish rule Norway underwent complete national extinction and became but a province of Denmark. Even the Reformation failed to arouse her from this lethargy, and not until 1814, when Norway was ceded to Sweden by the Peace of Kiel, was there evidence of a national awakening. The literary history of this whole period in Norway coincides with the history of Danish literature, with which it is inseparably connected.

After the *Eufemiavisur* of about 1300, so called from the German queen of Haakon Magnusson, who had these paraphrases of German originals—*Iwein*, *Duke Frederick of Normandy*, and *Flora and Blanchefleur*—made in the Norwegian language, there is no poetry until the period of learning subsequent to the Reformation. The first names at this time are Peder Dass (1647-1708), and Dorte Engelbrechtsdatter (1635-1716). The former, a Norwegian clergyman, wrote secular and religious poems which have made him to this day the favorite poet of the common people of Norway. The names that follow are those of Norwegians, but, as has been indicated, their place is in Danish and not in Norwegian literature. This is true of Ludvig Holberg (1684-1754), the father of the Danish drama; of Kristian Bjaumann Tullin (1728-1765), the poet of nature; of Johan Herman Wessel (1742-1785), the dramatist and poet, after Ewald, the second great name in the literature of the so-called 'Age of Enlightenment.'

An important factor in the development of a national Norwegian literature, as it was a matter of the greatest significance for Danish literature itself, was the formation of the *Norske Selskab*, or 'Norwegian Society,' in Copenhagen, in 1772. The intentions of the 'Society' were by no means to make propaganda for things Norwegian, as opposed to things Danish, but it is interesting to note that among its members are a number of poets who already exhibited a distinctly national feeling, which in choice of material and natural environment, and in inherent spirit, is not Danish, but Norwegian. The Norwegian poets of the period—Johan Nordal Brun (1745-1816), who wrote *Zarina*, the first Danish tragedy produced on the stage, and some of the most popular of the patriotic songs of Norway; Claus Fasting (1746-91), distinguished for his epigrams and criticism; Claus Frimann (1746-1829); Envold Falsen (1755-1808)—important as they were, have but little meaning at the present time. Edvard Storm (1749-94), who wrote ballads and songs in Norwegian peasant dialect, some of which are known throughout Norway to this day, was the only Norwegian writer of importance who held to the Danish side of this controversy, which so strikingly marks the last days of what may be called the Danish period in the literary history of Norway.

The actual history of Norwegian literature as a product in Norway of purely national conditions finds its beginning at the time of the separation of the Kingdom, in 1814, from Denmark. The 'Norwegian Society' presently changed the scene of its activity from Copenhagen to Christiania, but, although its traditions subsequently influenced popular taste, it never afterwards played an active part in literature. The first poetry which arose under these new conditions in Nor-

way was vehemently patriotic, and is called by the Norwegians themselves, from the day of the adoption of the Norwegian Constitution, *Syttendemai-Poesi*, the 'poetry of the 17th of May.' From among the numerous writers of the time three only, the so-called 'Trefoil,' may be mentioned as of especial significance, the lyric poet C. N. Schwach (1793-1860), the poet and dramatist H. A. Bjerregaard (1792-1842), and the novelist Mauritz Christoffer Hansen (1794-1842), whose best work is contained in his stories of peasant life. The first great poet of modern Norway, Henrik Wergeland (1808-45), became, as no other writer in Norway before him, the poet of the people. His first great success was achieved with a volume of lyrics, published in 1829. In 1830 appeared the long dramatic poem *Skabelsen, Mennesket og Messias*, "The Creation, Man, and Messiah," which drew out, in 1832, a pamphlet on "Henrik Wergeland's Poetic Art and Poetry," by Johan Sebastian Welhaven (1807-73), mercilessly attacking him for his sins of poetical commission. The controversy between the two poets, at first personal, subsequently assumed a wider character and presently divided the whole country into a national and a critical faction, the one the embodiment of the pro-Norwegian spirit of the 17th of May, the other the party of 'intelligence,' which looked to perpetuate what were in reality the hereditary tendencies of the 'Norwegian Society,' and to develop Norwegian culture harmoniously with that of Europe and especially that of Denmark. The contest was waged even more violently after the publication, in 1834, of Welhaven's polemical poem, a cycle of sonnets called *Norgea Dæmring*, "Norway's Twilight," in which he vigorously censured the mistaken zeal of the ultra-national faction which Wergeland represented. The battle was ultimately to Welhaven and his followers, who had, in point of fact, revolutionized the æsthetic taste of Norway, and by the introduction of a sound criticism had determined the direction of its future literary development. Welhaven, between 1839 and 1859, published numerous lyrical poems. His critical prose is among the finest that Norway has ever produced. Wergeland's best work was done after the downfall of his fortunes and his popularity. His last poem, *Den engelske Lods*, "The English Pilot," is his greatest. Andreas Munch (1811-84), poet and dramatist, followed the direction pointed out by Welhaven. His first work of importance was the romance *Den Eensomme*, "The Solitary," published in 1846. His *Billeder fra Nord og Syd*, "Pictures from North and South," is considered one of the best prose works in the language.

Important for its bearing upon the development of a national literature in Norway was the attention that was presently paid to the wealth of native material contained in the old folk-tales and popular poetry, which has been preserved among the peasantry in great abundance, and under the peculiar conditions of the country has retained an essentially national character in manner and matter. The principal workers in this field at the beginning were the naturalist Peter Christian Asbjørnsen (1812-85) and Jørgen Moe (1813-82), who published conjointly, in 1841, *Norske Folke-Eventyr*, "Norwegian Popular Tales." Asbjørnsen published subsequently *Norske Huldre-Eventyr og Folke-*

sagen, which contains descriptions of his own of natural scenery and popular life. The recognition of this material pointed out a new direction in Norwegian literature and has had a profound effect upon latter-day writers.

The present period of Norwegian literature, and the period of its broadest development, begins with Björnson and Ibsen, the greatest writers that Norway has produced. With them literature enters upon a new era of productivity at home, and, what had not been the case before, of influence abroad; for the work of these two poets, even at an early time in their career, had carried the name and fame of Norwegian literature far beyond the confines of Norway and of Scandinavia, until now, and principally through them, it has become in the widest sense a living and forceful part of the literature of the world. (For details see BJÖRNSSON; IBSEN.) Jonas Lie (b.1833), who plainly shows the influence of Björnson, has written sea-stories that have attained great popularity. His first novel, *Den Fremtsynte*, "The Visionary," appeared in 1870. His most successful and widely known novel is *Lodsen og hans Hustru*, "The Pilot and His Wife." He attains, however, a higher artistic result in his later novels of modern social life, *Livssalen*, "The Life Convict;" *Familien paa Gilje*, "The Family at Gilje;" *En Maelström*, "A Maelstrom;" and others that have been written since 1883. Anna Magdalena Thoresen (1819-1903) also shows the influence of Björnson in her tales of nature and popular life. Her *Billeder fra Midnatsolens Land*, "Pictures from the Land of the Midnight Sun," is possibly her best work. The most original of the woman writers of Norway is Camilla Collet (1813-95), the sister of the poet Wergeland, whose most important novel is the realistic *Ammandens Døttre*, "The Magistrate's Daughters." After Ibsen, Björnson, and Lie, the fourth great name in Norwegian literature of the present period is Alexander Kjelland (b.1849). Although his subjects are exclusively Scandinavian, he belongs, more than any of his countrymen, in his literary affinities less to Norway and more to Europe, whose general cultural tendencies he reflects. Kjelland's best work is contained in his short stories, the first volume of which appeared as *Novelletter* in 1870. His novels, the greatest of which is *Skipper Worse*, whose theme is the pietistic movement in Norway, are all novels of tendency.

Learned literature in Norway, although it has made important contributions to theology, to the physical sciences, and to philosophy, has found its highest and most characteristic expression in history. The founder of historical writing in Norway was Rudolf Keyser (1803-64), who wrote *Norges Historie*, "History of Norway;" *Den norske Kirkes Historie*, "History of the Church in Norway;" and other works on the history and antiquities and literature of his native country. His pupil, Peter Andreas Munch (1810-63), wrote, as his most important work, *Det norske Folks Historie*, "History of the Norwegian People." In collaboration with Keyser and with Carl Richard Unger (1817-97), he also did philological work of value in editing Old Norse texts. Johan Ernst Sars (b.1835), in his *Udsigt over den norske Historie*, "Review of Norwegian History," has produced one of the most notable prose works in the language.

In every field of literary activity modern Norway has unfolded, and is still unfolding, an extraordinary development, and this not only from the point of productivity, but in the quality and character of the work produced. The most distinct tendencies in Norwegian literature of the present period are the pessimistic-naturalistic direction originally pointed out by Ibsen, and the optimistic-realistic direction of Björnson and his followers, but there are writers who belong to neither school. Other writers than those mentioned have made a name outside of Norway, as well as at home. Among them are Aasmund Olafsson Vinje (1818-70), Kristoffer Janson (b.1841), Arne Garborg (b.1851), Amalie Skram (b.1857), and still more recently, Knut Hamsun, Gabriel Finne, and Vilhelm Krag.

NORWEGIAN MUSIC. See SCANDINAVIAN MUSIC.

NORWEGIUM (Neo-Lat., from ML. *Norvegia*, *Norvegia*, Norway). A name given by Dahll to a substance separated by him from the mineral *geradorffite* found on the island of Ostveø, Norway. It is also said to exist in some specimens of unrefined lead. Its elementary character, however, has not been positively established.

NORWICH, nôr'rich or nôr'rij. Capital of Norfolk, England, and a county in itself, on the Wensum, immediately above its confluence with the Yare, 20 miles west of Yarmouth, and 98 miles north-northeast of London (Map: England, H 4). The town covers an area of about five miles in circumference, and is skirted on its north and east sides by the river. On the west and south it was surrounded by walls which have been removed to make room for the extension of the city. In the market-place and its vicinity are many large shops and good houses. The castle, finely situated on an elevation near the centre of the town, originally covered with its works an area of about 23 acres. The bridge over the ditch has one of the largest and most perfect Anglo-Norman arches in existence. The massive quadrangular Norman keep is now used as a museum. The cathedral, almost wholly Norman in plan, was founded in 1094 by Bishop Herbert Losinga. It is 411 feet long, 191 feet broad at the transepts, and is surmounted by a spire 315 feet high. Near the cathedral are a number of ancient and interesting structures now more or less in ruins, among which may be mentioned Saint Ethelbert's and the Erpingham Gate, the former in Decorated English, the latter in late Perpendicular, and both valuable and rich specimens of their styles. There are many places of worship, of which Saint Peter's Mancroft, a handsome cruciform edifice of the fifteenth century, with a remarkably fine peal of 12 bells, Saint Andrew's, Saint Clement's, Saint George's, Saint Giles's Saint Michael's, and others are worthy of mention. The free grammar school was founded by Edward VI. The city possesses public recreation grounds covering an area of 200 acres,

and owns profitable real estate, markets, and a sewage farm. It also maintains a free public library, baths, Norwich Castle, gardens, and museum, and provides allotments and technical education. Three miles south of Norwich is Castor Saint Edmunds, which prior to the Roman Era was called Caister, and under the Romans received the name Venta Icenorum. It is the seat of extensive and flourishing industries, among which are the manufacture of mustard, starch, beer, shoes, foundry products, and agricultural implements, and dyeing and malting. It has also extensive nursery gardens. The city was one of the earliest manufacturing centres for textiles in England. This branch of industry, however, has declined. Its shipping trade, facilitated by a canal and river system of communication with the sea, is chiefly in agricultural products and coal. Annual fairs are held.

Norwich occupies a place in history from the time of the earliest Danish invasions. It had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of Venta Icenorum, who gave it the name of North-wic, or northern station or town. The East Anglian bishopric was removed hither in 1094. About 4000 Flemings settled at Norwich in the reign of Elizabeth, and gave great impetus to the prosperity of the town by the branches of manufacture which they introduced. The municipality dates from the reign of Henry II. Norwich returns two members to Parliament. Population, in 1851, 68,000; in 1891, 101,300; in 1901, 111,728. Consult: Jessopp, *Norwich* (London, 1884); Bayne, *History of Norwich* (Norwich, 1889); Quennell, *Norwich Cathedral, with a History of the See* (London, 1898).

NORWICH. A city and one of the county-seats of New London County, Conn., 90 miles southwest of Boston, Mass., and 50 miles southeast of the State capital, Hartford; on the Thames River, at the head of navigation, and on the Central Vermont and the New York, New Haven and Hartford railroads (Map: Connecticut, G 3). It is built among the hills, in the valleys of the Yantic and Shetucket, which here form the Thames; and has exceptional water power, a prominent feature in the development of its industrial interests. There is a large trade in lumber, coal, manufacturers' supplies, groceries, dry goods, etc. Norwich is one of the prominent manufacturing centres of the State, the chief articles produced being firearms, cotton, silk, and woolen fabrics, stoves and furniture, rolled and cast iron, leather and belting, and a great variety of machinery. The city is noted for its picturesque beauty, and possesses many fine residences, several public parks, and streets shaded with beautiful elms and maples. It has a Free Academy, which was built and endowed by private subscriptions from wealthy citizens. A fine new building, including an art museum, and costing nearly \$200,000, the gift of W. A. Slater, has been erected for the academy. Other institutions include the William W. Backus Hospital, representing an endowment of over \$500,000, the Otis Free Library, having 24,000 volumes with an annual circulation of nearly 100,000, and the Y. M. C. A. The courthouse and Saint Patrick's Roman Catholic Church are notable structures. The Indian bury-

ing ground where Uncas is buried is of historic interest. So is the spot where Miantonomoh fell. The government, under a revised charter of 1877, is vested in a mayor, chosen every two years, and a bicameral council, elected one-half each year on a general ticket, which controls elections of all administrative officials, with the exception of one water commissioner, who is annually chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 16,156; in 1900, 17,251. Settled in 1659 by a company from Saybrook, Norwich (named from Norwich, England) was chartered as a city in 1784 and rechartered in 1871. It was the home of Samuel, Jabez, and Jedediah Huntington, Christopher Leffingwell, and Nathaniel Niles—all prominent during the Revolutionary period. Consult: Gilman, *Historical Discourse Delivered at Norwich in 1859* (Boston, 1859); and Caulkins, *History of Norwich* (Hartford, 1866).

NORWICH. A village and the county-seat of Chenango County, N. Y., 42 miles northeast of Binghamton; on the Chenango River, and on the New York, Ontario and Western and the Delaware, Lackawanna and Western railroads (Map: New York, E 3). It has a village hospital and a public library with 12,000 volumes; and among its fine structures are the municipal building, county jail, and the Lackawanna depot. Norwich is of considerable importance as an industrial centre, having railroad shops, a blast furnace, stone quarries, and manufactories of drugs and medicines, perfumes, furniture, gloves, silk ribbons, hammers, etc. There are also a number of creameries, the village being surrounded by a productive dairying and farming section. Population, in 1890, 5212; in 1900, 5766.

NORWICH, GEORGE GORING, Earl of (c.1583-1663). An English Royalist. He was made clerk of the Council of Wales, and among other important monopolies a large share of the tobacco grant was given to him (1636). After Charles I. had become a prisoner in the hands of Parliament, Goring headed an abortive Royalist rising in Kent. The Commons voted that he should be banished, but rescinded this vote, and a special court sentenced him to death, but he was not executed, either because the Speaker, Lenthall, who gave the casting vote, had received favor from Goring, or on the pleading of the Dutch and Spanish ambassadors. From 1652 to the Restoration he lived on the Continent, and Charles II. granted him a pension of £2000 and reappointed him to the Privy Council.

NORWICH CRESTED CANARY-BIRD. See CANARY.

NORWICH UNIVERSITY. An institution of learning at Norwich, Vt., founded at Middletown, Conn., in 1819, by Capt. Alden Partridge, and known as the American Literary, Scientific, and Military College. In 1829 it was removed to Norwich, Vt., and was incorporated under its present name in 1834. In 1898 it was officially recognized as the military college of the State of Vermont. It has long been known as an engineering and scientific school, and many of its graduates have served in the various wars. In 1903 the institution had 9 instructors and 70 students. Dewey Hall, a memorial building erected in honor of Admiral George Dewey, a former student, was opened in 1902.

NORWOOD. An electoral district and favorite residential section in the south of the metropolitan borough of Lambeth, London, England, eight miles south of Saint Paul's Cathedral (Map: London, F 7). It was formerly a suburban village noted for Beulah Spa, a popular pleasure ground picturesquely laid out around a mineral spring, now built over, and represented by the Beulah Spa hotel. Norwood is divided into Upper, Lower, and South Norwood. It adjoins the grounds of the Crystal Palace. Norwood Junction is an important suburban railway station. Population, in 1891, 28,248; in 1901, 35,887.

NORWOOD. A town in Norfolk County, Mass., 14 miles southwest of Boston; on the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 3). It has the Morrill Memorial Library with 7000 volumes; and among its industrial plants are railroad repair shops, large tanneries, an iron foundry, manufacturing of glue and ink, and an extensive printing establishment. Norwood was incorporated in 1872; the government is administered through town meetings. The water-works are owned by the municipality. Population, in 1890, 3733; in 1900, 4880.

NORWOOD. A city in Hamilton County, Ohio, adjoining Cincinnati on the northeast; on the Baltimore and Ohio Southwestern, the Norfolk and Western, and the Cincinnati, Lebanon and Northern railroads (Map: Ohio, A 7). It is well laid out on a site of great natural beauty, and is a favorite residential suburb of Cincinnati. There are several important manufacturing establishments whose factory buildings are noteworthy for their architecture and for their splendid equipment. Among these plants are the lithographing and playing-card works, the elastic-bookcase factory, and the electrical manufacturing concern. Pianos, laundry machinery, washing-machines, machine tools and iron-working machinery, iron castings, wood-mill-work, and paper bags and specialties also are manufactured. Settled about 1790, Norwood was incorporated as a village under the general laws of 1888 and became a city in 1902. The water-works and electric light plant are owned and operated by the municipality. Population, in 1900, 6480.

NOSAIRIANS. A Mohammedan sect. See ANSARIES.

NOSE (AS. *nosu*, *nasu*, OHG. *nasa*, Ger. *Nase*, nose; connected with Lat. *nasus*, Lith. *nosis*, OChurch Slav. *nosŭ*, Skt. *nas*, nose). The nose is not only the organ of smell, but is likewise part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an external part—the projecting portion, to which the term nose is popularly restricted; and an internal part, consisting of two chief cavities, the *nasal fossæ*, separated from one another by a vertical septum, and subdivided by spongy or turbinated cells, or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicating by narrow apertures.

The external portion of this organ may be described as a triangular pyramid which projects from the centre of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal

bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the nostrils, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissæ*), which project across the openings, and serve to arrest the passage of foreign substances which might be drawn up with air intended for respiration. The skeleton or framework of the nose is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed *sesamoid cartilages*; there is also the cartilage of the septum which separates the nostrils, and is in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forming a complete partition between the right and left nasal fossæ. It is the lower lateral, termed by some writers the *alar cartilage*, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe.

The *nasal fossæ*, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and near the orifices of the Eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucuous membrane lining the nose and its cavities is called *pituitary*, from the nature of its secretion, or *Schneiderian*, from Schneider, the first anatomist who showed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see *EYE*), and with that of the pharynx and middle ear posteriorly. On the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. In the vicinity of the nostrils, the mucous membrane exhibits papillæ and a scaly epithelium, like the corresponding parts of the skin. In the sinuses, and in all the lower region of the nose, the epithelium is of extreme delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the olfactory region—the epithelium changes from ciliated to columnar, and assumes a more or less rich sienna-brown tint, and increases remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggrega-

tion of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker color than the rest, from their containing a brown pigment in their interior. The olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve. They are named Bowman's glands.

The nerves of the nose are the first pair or olfactory, which are specially connected with the sense of smell; branches of the fifth pair, which confer ordinary sensibility on its skin and mucous membrane; and motor filaments, from the facial nerves to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the brain by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribriform plate of the ethmoid bone, expands into an oblong mass of grayish-white substance, the olfactory bulb. From the lower surface of this bulb are given off the olfactory filaments, fifteen or twenty in number, which pass through the cribriform foramina, and are distributed to the mucous membrane of the olfactory region. The branches of the fifth pair (or trifacial) given to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the skin and mucous membrane in the vicinity of the nostrils, and the nasopalatine nerve (derived from Meckel's ganglion, which is connected with the superior maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. Whatever may be the nature of the odoriferous matter, it is necessary that it should be transmitted by a respiratory current through the nostrils to the true olfactory region, and dissolved or suspended in the fluid with which the olfactory membrane is normally covered. The proper condition of this fluid is one of the essential conditions of the perception of odors. If the membrane is too dry, or if there is an inordinate excretion of fluid from its surface (both of which conditions occur in catarrh or cold in the head), smell is impaired or lost, in consequence of the necessary penetration of the stimulating odor to the nervous filaments being prevented.

It has been observed that when the nostrils are filled with rose water or eau de Cologne, no odor is perceived, and simply filling the nostrils with distilled water suspends for a time the sense of smell. If, on the other hand, the scent be dissolved in 'normal saline solution,' which closely resembles the natural secretion, the odor is perceived.

The sense of taste is often confused with that of smell. We speak of 'tasting' an odoriferous substance, such as an onion, or a savory dish, or a wine, when in reality we perceive it through the olfactory nerves. This is proved by the fact that the taste for these substances is lost when the smell becomes impaired.

The acuteness of the sense of smell is far greater in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilized men the utility of this sense is comparatively small; but it is occasionally much increased when other senses are deficient. Among many savage tribes the sense is almost as acute

as in many of the lower mammals. See *NOSTRILS*; *SMELL*.

NOSE, COMPARATIVE ANATOMY OF THE. In the ordinary usage of the word, no animals but mammals have noses; but in the widest sense of an organ of smell, the nose is found in all vertebrates and in some lower animals. Owing to the close relation that exists between the sense of taste and the sense of smell, it is impossible to determine beyond question the function of certain organs among the lower animals, but in several cases evidence has been produced to show that ciliated pits or patches have a function similar to, if not identical with, that of smell in vertebrates. Thus as low as the ctenophores and some medusæ, there occur special areas covered with cilia, to which the sense of taste or smell has been assigned. In many flatworms, in nemerteans, and in many true worms, ciliated grooves, pits, and prominences occur, which are certainly sensory and probably olfactory. Whether organs of smell occur among crustaceans and insects is not beyond doubt, but short processes, open at the point and with special nerve connections located on the antennæ, are regarded as organs of smell. There is much evidence in support of the belief that insects smell, and the antennæ are almost certainly the seat of whatever such sense they possess. Among echinoderms there are isolated cases of organs which may be olfactory, notably the sensory cups on the inner surface of the tentacles in Synapta. Among the mollusks, the patches of densely ciliated epithelium in the mantle-cavity, known as 'osphradia,' are very probably organs of smell. In Amphioxus and the cyclostomes there is a single pit or sac, lined with an epithelium consisting of ciliated and sensory (olfactory) cells. In the elasmobranch fishes the olfactory sacs lie on the under surface of the snout, but in all the vertebrates they are situated somewhere between the eyes and the end of the snout, on the upper surface.

In all animals above cyclostomes the nasal sacs are inclosed in cartilaginous or bony cases, forming a prominent part of the skull. The nostrils of bony fishes are divided into two parts by a septum, which is sometimes so wide as to give rise to four wholly distinct nostrils. The mucous membrane lining the nasal sacs of fishes is raised up into a number of complex radial folds, thus increasing the sensory surface. The dipnoid fishes differ from the other true fishes in that the nasal sacs communicate with the cavity of the mouth as well as with the exterior, just as they do in all higher vertebrates. In amphibians we find for the first time turbinal bones which serve to increase the sensory surface of the nasal cavities. There are also glands present in the sensory epithelium, serving to keep it moist. Moreover, there is a canal connecting the anterior angle of the orbit with the nasal cavity, known as the naso-lachrymal duct, which is of use in conveying surplus lachrymal secretion (tears) into the nasal cavity and thence into the pharynx through the posterior nares. This duct is present in all the higher vertebrates also. In reptiles the olfactory organ is rather simple, especially in lizards and snakes; there is only a single turbinal, though crocodiles have on the outer side of the cavity a second prominence called the pseudo-turbinal. Birds also have only

a single true turbinal, but two pseudo-turbinals are present, and the true turbinal is often more or less rolled on itself. In mammals the nasal cavity is large, and the turbinals are extended to form a spongy labyrinth, the projections of which, known as olfactory scrolls, are normally five in number, though they sometimes become more or less fused in pairs. Thus there is sometimes one, but usually two, superior or upper turbinals, and there is usually one, but sometimes two, middle turbinals. The so-called superior and middle turbinals of man are somewhat different in their origin, but the inferior turbinal is derived from and corresponds to the single turbinal of reptiles and birds.

The external nose of mammals is formed by an extension outward of the nasal bones, supported and strengthened by a cartilaginous outgrowth of the ethmoid. The size and appearance of the nose depends chiefly upon its function, for it is often elongated for some special purpose.

NOSE-APE. See PROBOSCIS MONKEY.

NOSEBLEED. See EPISTAXIS.

NOS/ELITE (named in honor of K. W. Nose, a German chemist), or **NOS/AN.** A mineral made up of the sulphates and silicates of sodium and aluminum. It crystallizes in the isometric system, is translucent, and has a gray, blue, or brown color. It occurs in certain igneous rocks such as phonolite and nepheline syenite. It is found chiefly in Germany, and on the Canary and Cape Verde Islands.

NOSOL/OGY (from Gk. νόσος, *nosos*, disease + -λογία, *-logia*, account, from λέγειν, *legein*, to say). The branch of medical science which treats of the classification and nomenclature of diseases. The old idea was that diseases could be divided into classes, orders, genera, and species. Many systems have been proposed, used, and abandoned. Some of these have been based upon theories of causation, others upon the symptoms manifested, the part or system of the body affected, or the pathological effects observed.

For statistical purposes the system devised by Dr. William Farr, a distinguished medical statistician of London, has been more recently used in Great Britain and America, its most complete development being the nomenclature of diseases issued by the Royal College of Physicians and Surgeons in 1884, the latest revision being in 1894.

This system divides all diseases into two great classes, namely, general and local diseases. The first class includes all those maladies which affect the whole body, or which may affect several parts at one time, and is divided into four groups. The first group includes diseases due to morbid poisons or specific infections, such as scarlet fever, measles, etc. The second group embraces diseases which are dependent upon external agencies other than the specific infections, as parasites, chemical poisons, climate, etc. The third group includes the so-called developmental diseases, such as malformations and old age. The fourth group embraces a number of unclassified affections, as rheumatism, gout, leprosy, cretinism, etc. The second great class, that of local diseases, includes those peculiar to the various systems of the body, such as the nervous system, the circulatory system, etc.

It is evident that no single scheme of classification will answer every purpose. It is equally

obvious that every system must be subject to constant modification by the advances in medical knowledge. This is notably true of the recent discoveries in bacteriology. Among writers of the present day the tendency is toward a very simple classification, and the following arrangement of diseases may be accepted as the one which, with modifications, is in general use:

(1) *Specific infectious diseases*, represented by the exanthemata, syphilis, tuberculosis, and malaria.

(2) *Constitutional diseases*, for example, gout, rheumatism, and diabetes.

(3) *Diseases of the digestive system*, e.g. gastritis, jaundice, and enteritis.

(4) *Diseases of the respiratory system*, as nasal catarrh, laryngitis, bronchitis, and pneumonia.

(5) *Diseases of the circulatory system*, as endocarditis, aneurism, and arterio-sclerosis.

(6) *Diseases of the blood and ductless glands*, as anæmia, leucocythemia, Addison's disease, and goitre.

(7) *Diseases of the kidneys*, as Bright's disease, uræmia, and pyelitis.

(8) *Diseases of the nervous system* (including the brain, spinal cord, and nerves), as epilepsy, chorea, myelitis, and sciatica.

(9) *Diseases of the muscles*, the muscular atrophies and dystrophies.

(10) *The intoxications*: alcoholism, the drug habits, lead and arsenic poisoning.

(11) *Diseases due to animal parasites*: tape-worm, trichiniasis, and pediculosis.

To these must be added the diseases peculiar to special organs, the eye, ear, skin, and generative organs.

NOSSI-BÉ, nòs'sé'bá'. An island off the northwest coast of Madagascar, from which it is separated by a narrow channel. It has an area of 111 square miles, is volcanic and mountainous, and well wooded. Parts of it are well cultivated, and produce sugar-cane, coffee, rice, and vanilla. The chief town is Hellville. On the south coast, an important port of call with shipping amounting to more than half a million tons annually. The population of the island in 1901 was 9500, chiefly Sakalavas of Madagascar. The island was ceded to France by Madagascar in 1840, and in 1896, when the latter became a French possession, Nossi-Bé was placed under the authority of the Governor-General of Madagascar.

NOSTAL/GIA (Neo-Lat., from Gk. νοσταλγία, from νοσταλγῆν, *nostalgēin*, to be homesick, from νόστος, *nostos*, return + ἄλγος, *algos*, grief, distress). A feeling of melancholy, caused by grief on account of absence from one's home or country, of which the English equivalent is *homesickness*. Nostalgia represents a combination of psychic and bodily disturbances, and must be regarded as a disease. It may lead to melancholia and even death. It is more apt to affect persons whose absence from home is forced than those whose absence is voluntary.

NOS'TRADA'MUS (MICHEL DE NOTREDAME) (1503-66). A French astrologer of Jewish descent, born at Saint-Remy in Provence. He entered the College of Avignon, and after completing his course there went to Montpellier, where he studied medicine. At this time a terrible pestilence desolated the southern part of France, and during the four years that it continued

(1524-29) Nostradamus went from one city to another giving his aid to the stricken. After the pestilence had subsided he returned to Montpellier to finish his studies. He traveled for a number of years, and in 1544 settled at Salon. The next year a new epidemic of the pest swept over the country and he accepted the formal invitation of the authorities to visit Aix and Lyons, where he treated his patients with a secret remedy which worked marvelous cures. This gave him a great reputation, and a few years later his claim that he had the power of reading the future attracted widespread attention and became the subject of much controversy. In 1550 he began to write his famous *Centuries*, mystic prophecies in rhymed quatrains, the first series of which was published at Lyons in 1555. Catharine de' Medici invited their author to Court, where he reached the height of his fame. Soon afterwards he returned to Salon. Besides his *Centuries*, Nostradamus wrote: *Traité des fardements* (1552); *Le remède très utile contre la peste et toutes fièvres pestilentielles* (1561); and *Opuscul de plusieurs esquises receptes* (1572); and from 1550 to his death published an *Almanach* that had a wide circulation. Consult: Jaubert, *Vie de M. Nostradamus* (Amsterdam, 1656); Guynaud, *La concordance des prophéties de Nostradamus avec l'histoire* (Paris, 1693); and Baresté, *Nostradamus* (ib., 1842).

NOSTRILS (AS. *nosþyrl, næs þyrl*, from *nosu, nasu*, nose + *þyrl, pyrel*, hole, from *pyrel*, OHG. *durikhill, durchil*, perforated, from AS. *urh*, OHG. *durnh*, Ger. *durch*, through), DISEASES OF THE. This classification is no longer used, and diseases formerly appearing under this head will be found under their respective titles. (See CATARRH; OZENA; EPISTAXIS; RHINITIS; POLYPUS; NOSE.) Foreign bodies are often inserted into the nostrils by children, and become impacted. They may usually be extracted by a small scoop, a bent probe, or forceps. If they cannot be removed by these means, they must be pushed back into the throat through the posterior nares. Children are occasionally born with imperforate nostrils. This congenital malformation may, however, usually be remedied by surgical means.

NOSTRUM (Lat., our own). A term applied to patent or quack medicines whose ingredients are kept secret by the inventor for the purpose of controlling the manufacture of them; hence the term has come to be used in a derogatory sense.

NOTA, ALBERTO, Baron (1775-1847). An Italian dramatist, born at Turin. He was educated for the bar, practiced law, and finally obtained the position of secretary to the future King Charles Albert. He afterwards was appointed administrator of the district of Bobbio (1820), and of San Remo (1823), and still later general intendant at Casale and Cuneo. He wrote comedies in imitation of Molière and Goldoni. His thirty or more plays have little originality. The best of them are: *La fiera*, *Rivoluzioni in amore*, *Il benefattore*, *La pace domestica*, *L'irrequieto*, *Il progettista*, *La cedova in solitudine*, and *L'amor timido*. His works were very popular, and went through ten editions between 1816 and 1829.

NOTABLES (OF., Fr. *notable*, from Lat. *notabilis*, noteworthy, from *notare*, to note, mark, from *nota*, mark, from *noscere*, to know; ulti-

mately connected with Eng. *know*). The name given in France before the Revolution of 1789 to persons of noble birth, social distinction, or political importance, who were summoned to meet in the Assembly of Notables. The States-General (q.v.) was too great a check on the despotism of the monarchy, and beginning with Charles V., the French kings adopted the expedient of calling in their stead Assemblies of Notables, composed of those who were likely to be in favor of the projects of the Crown. Their whole proceedings were guided by the King or his ministers. They showed a particular readiness in granting subsidies, from which they themselves, as belonging to the privileged classes, were exempt. An Assembly of Notables, convened in Paris by Richelieu in 1626, and presided over by Gaston d'Orléans, brother of Louis XIII., consisted of only 35 members. In 1878, when the state of the finances threatened the country with bankruptcy, Louis XVI., at the instigation of Calonne (q.v.), had recourse to an Assembly of Notables, which assembled on February 22, 1787. In spite of their readiness to accept certain reforms in the administrative and financial system, they showed themselves jealous of their ancient privileges and were inclined to shift the responsibility for the difficult state of affairs on the Government. Some of the Notables even advocated the summoning of the States-General in the expectation, probably, that the latter would devise some way of relieving the distressed conditions of the country without interfering with the prerogatives of the privileged orders. On May 25th the Notables were dismissed. Necker, who was later placed at the head of affairs, assembled the Notables for the last time on November 6, 1788, to consult with them concerning the form in which the States-General should be convened. The Notables declared against every innovation which they had sanctioned the year previous, and were especially opposed to the double representation of the Third Estate. This opposition compelled the Court to resort to half measures, which helped to prepare the way for the Revolution. The Notables were finally dissolved December 12, 1788. See FRANCE; FRENCH REVOLUTION.

NOTARY PUBLIC (Lat. *Notarius*, one who writes, from *nota*, mark). An officer duly authorized to attest or certify legal instruments, and to perform certain other official acts, usually of a ministerial character. The office is created by statute, and the functions of a notary public vary in different jurisdictions. Notaries were known in England before the Conquest, and in all the countries of Europe at an even earlier time. They were appointed by the popes at Rome, and acted as officials in the ecclesiastical courts, in addition to exercising certain secular powers. In England the authority to appoint notaries was finally delegated by the Roman See to the Archbishop of Canterbury, and after the Reformation a statute was enacted (25 Hen. VIII., c. 21, § 4) confirming the right in the Archbishop as a high prelate in the English Church.

With the development of the commerce of England and the 'law merchant' the office of notary public increased in importance very rapidly. Notaries were employed to protest commercial paper, to witness certain papers under the maritime law, and were gradually vested with the

powers which they exercise generally to-day. In the United States, notaries are appointed by the Governors of the States; and the authority of a notary to act, therefore, does not extend beyond the limits of the particular territory in a State for which he is appointed. This territory is usually a county, and he cannot perform any acts in another county unless he complies with certain prescribed formalities, such as filing a certificate and paying an additional fee. In many States a notary may thus extend his official powers to all the counties of his State, but he cannot exercise his powers except for the county in which he is personally present at any given time.

In general, any male citizen is eligible to appointment as a notary. In most States, in order to qualify, a notary must take an oath of office, and in some he must give a bond to secure the faithful performance of the duties of his office; and a breach of his official duties is punished criminally. A notary's seal must be affixed to many legal instruments authenticated before him. The statutes of the different States vary as to the necessity of a notarial seal.

As notaries are State officers, their acts in matters in which the Federal Government is involved are not valid except in cases where their authority is specially recognized by the acts of Congress. These Federal statutes provide that a notary may administer all oaths and take all acknowledgments which a justice of the peace may do, and the authority of notaries to take depositions, affidavits, etc., for use in the United States courts is also expressly authorized. The notarial seal must be affixed to all documents intended to be used in the courts or any department of the Federal Government. The United States statutes in this regard are very strictly construed.

The general powers of a notary as a State officer are as follows: to take acknowledgment of legal instruments, such as deeds, mortgages, bills of sale, etc.; to take affidavits; to take depositions (q.v.); to protest commercial paper; and, in some States, to exercise the powers of a justice of the peace.

A notary may be disqualified to act by reason of his financial interest in a matter brought before him. Thus where a notary is a grantee in a deed, he cannot take the acknowledgment of the grantor, or person conveying the property. Relationship to one of the parties to a deed or other legal instrument will not ordinarily disqualify a notary from taking the acknowledgment of that party, as it is a ministerial act; but where the notary is commissioned to take depositions, it is considered more in the nature of a judicial act, and if he is a near relative to one of the parties to the suit, in most jurisdictions he is disqualified for that reason. The fees of notaries are fixed by statute in each State, and generally it is a misdemeanor for a notary to demand and receive more than the statutory fee for an act. By statute in most jurisdictions certain other officials, such as judges, justices of the peace, mayors of cities, etc., are vested with notarial powers. See EVIDENCE; ACKNOWLEDGMENT; AFFIDAVIT.

NOTATION (Lat. *notatio*, designation, from *notare*, to mark, from *nota*, mark). In arithmetic, a term applied to a system of designating numbers by figures, or *notæ*, as they were often called in the Middle Ages. The chief number

notations of the early races, before the perfecting of the position system, conform to one of three systems, the repeating, the alphabetic, and the initial-letter systems, although these are not mutually exclusive. By the repeating system is meant the plan of repeating a chosen symbol, especially for 1, 10, 100—on the additive principle, so as to represent other numbers twice, or three or more times as great. Thus, in the Egyptian system, the symbol $\cap$ stands for 10, and the combination $\cap\cap$ stands for 30. By the alphabetic system is meant the plan of representing numbers by letters in alphabetic order. And by the initial-letter system is meant the plan of representing numbers by the initial letters of the corresponding language forms. These tendencies are exhibited in the following tables:

REPEATING SYSTEMS.

Egyptian	1, $\cap$, $\odot$, ---
Babylonian	∇ , $\triangleleft$, ∇ ---
Early Greek	I, Δ , H, M, ---
Early Roman	I, X, $\odot$, $\odot$, ---
Late Roman	I, X, C, M, ---

ALPHABETIC AND INITIAL-LETTER SYSTEMS.

Hebrew	$\aleph$, $\beth$, γ , δ
Hindu	—, =, $\equiv$, and the initial letters.
Late Greek	α , β , γ , ---

The Hebrew system was used by Hebrew writers as late as the twelfth century, in connection with zero, after contact with the Arabic system.

Among the Egyptians numbers were written running from right to left in the hieratic writing, with varying direction in the hieroglyphics. In the latter the numbers were either written out in words or represented by symbols for each unit, repeated as often as necessary. In the hieratic symbols the figure for the unit of higher order stands to the right of the one of lower order. The Phœnician system contained twenty-two characters, derived from the symbols of the Egyptians.

The Babylonian cuneiform inscriptions proceed from left to right, which must be looked upon as exceptional in a Semitic language. The units of higher order stand on the left of those of lower order. The symbols used in writing are chiefly a horizontal wedge, a vertical wedge, and a combination of the two at an angle. The symbols were written beside one another, or, for ease of reading and to save space, over one another. The symbols for 1, 4, 10, 100, 14, 400, respectively, are as follows:

For numbers exceeding 100 there was also used, besides the mere juxtaposition, a multiplicative principle; the symbol representing the number of hundreds was placed at the left of the symbol for hundreds, as in the case of 400, already shown. The Babylonians probably had no symbol for zero.

The oldest Greek numerals (aside from the written words) were, in general, the initial letters of the fundamental numbers, I for 1, II for 5 (*πέντε*), Δ for 10 (*δέκα*), and these were repeated as often as necessary. These numerals are described by the Byzantine grammarian Herodianus (c.200 A.D.), and hence are spoken of

as Herodianic numbers. Shortly after B.C. 500 two new systems appeared. One used the 24 letters of the Ionic alphabet in their natural order for the numbers from 1 to 24. The other arranged these letters apparently at random, but actually in an order fixed arbitrarily; thus, $\alpha=1, \beta=2, \dots, \iota=10, \kappa=20, \dots, \rho=100, \sigma=200$, etc. For 6, 90, and 900 exception was made, and the symbols ς, ϕ, θ were used respectively. Here, too, there is no special symbol for the zero.

The Roman numerals were probably inherited from the Etruscans. The noteworthy peculiarities are the lack of the zero; the subtractive principle whereby the value of a symbol was diminished by placing before it one of a lower order ($IV=4, IX=9, XL=40, XC=90$), even in cases where the language itself did not signify a subtraction; and finally the multiplicative effect of a bar over the numerals ($\overline{XXX}=30,000, \overline{C}=100,000$). Also for certain fractions there were special symbols and names. According to Mommsen, the Roman number-symbols I, V, X represent the finger, the hand, and the double hand, but they are more probably from old Etruscan letter forms. The use of the bar (*vinculum* or *titulus*) was very uncertain. Thus in the tenth century we find it used over the I and X (as among later Romans) to increase the value 1000-fold, but over the M it had no significance. The symbols, too, were carelessly used. Thus, $XII\overline{M}M$ meant 10,000 and $C\overline{M}$ meant 100,000. The subtractive principle, although known to the later Romans, was little used until very recently, as witness $IIII$ for IV, continued from the early clock faces to those of to-day.

The number system of the Hindus is of special interest, because it is to these Aryans or to the Arabs that we owe the valuable position system now in use. Their oldest symbols for the numbers from 4 to 9 seem to have been merely the initials of their number-words, and the use of letters as figures seems to have been quite prevalent from the third century B.C. The zero is of later origin, and its introduction is not proved with certainty until after 400 A.D. The writing of numbers was carried on, chiefly according to the position system, in various ways. One plan, which Aryabhatta records, represented the numbers from 1 to 25 by the twenty-five consonants of the Sanskrit alphabet, and the succeeding tens (30, 40...100) by the semi-vowels and sibilants. A series of vowels and diphthongs formed multipliers consisting of powers of ten, *ga* meaning 3, *gi* 300, *gu* 30,000, *gau* 3. 10^4 . In this there is no application of the position system, but it appears in two other methods of writing numbers in use among the arithmeticians of Southern India. Both of these plans are distinguished by the fact that the same number can be made up in various ways. The first method consisted in allowing the alphabet, in groups of nine symbols, to denote the numbers from 1 to 9 repeatedly, while certain vowels represented the zeros. If in the English alphabet, according to this method, the numbers from 1 to 9 be denoted by the consonants *b, c, \dots, z*, so that after two countings one finally has $z=2$, and zero be denoted by every vowel or combination of vowels, the number 60502

might be indicated by *siren* or *heron*, and might be introduced by some other words in the text. The second method employed type-words. Thus *abdhi* (one of the 4 seas)=4, *surya* (the sun with its 12 houses)=12, *agvin* (the two sons of the sun)=2. The combination *abdhi-suryagvinas* denoted the number 2124.

In the eighth century (c.772) the Arabs, whose numerals consisted of abbreviated number-words of an inferior type, the *Divani*, became acquainted with the Hindu system. From these figures there arose, among the Western Arabs, the *Gubar* numerals (dust numerals). These Gubar numerals, almost entirely forgotten to-day among the Arabs themselves, are the ancestors of our modern numerals. These primitive Western forms, used in the abacus-calculation, are found in the West European manuscripts of the eleventh and twelfth centuries, and owe much of their prominence to Gerbert, afterwards Pope Sylvester II. (q.v.), and to Leonardo Fibonacci (q.v.).

The arithmetic of the Western nations, cultivated to a considerable extent in the cloister schools from the ninth century on, employed, besides the abacus, the Roman numerals, and consequently did not use a symbol for zero. In Germany, up to the year 1500, the Roman symbols were called German numerals, in distinction from the symbols of Arab-Hindu origin, which included the zero (Arabic, *as-sifr*; Sanskrit, *sunya*, the void). The latter were called ciphers (*Ziffern*). From the fifteenth century on these Arab-Hindu numerals appear more frequently in Germany on monuments and in churches, but at that time they had not become common property. A frequent and free use of the zero in the thirteenth century is shown in tables for the calculation of the tides at London, and of the duration of moonlight. In the year 1471 there appeared in Cologne a work of Petrarch with page-numbers in Hindu figures at the top. In 1478 the first printed arithmetic appeared at Treviso, and in 1482 the first German arithmetic at Bamberg, and these explained the system. Besides the ordinary forms of numerals everywhere used to-day, the following forms for 4, 5, 7 were used in Germany at the time of the struggle between the Roman and Hindu notations:

8.9.A.

The derivation of the modern numerals is illustrated by the examples below, which are taken in succession from the Sanskrit, the figures used by Gerbert (latter part of the tenth century), the Eastern Arab, the Western Arab Gubar numerals, the numerals of the eleventh, thirteenth, and sixteenth centuries:

In the sixteenth century the Hindu position arithmetic and its notation first found complete introduction among all the civilized peoples of the West. By this means was fulfilled one of the indispensable conditions for the development of common arithmetic in the schools and in the service of trade and commerce.

SCALES OF NOTATION. The explanation of the fact that 10 is almost everywhere found as the base of the system of counting is seen in the common use of the fingers in elementary calculations. In all ancient civilizations finger reckoning was known, and even to-day it is carried on to a remarkable extent among savage peoples. It is evident that any integer may be made the base of a scale of notation, the number of symbols being the same as the number of units in the base. Some languages contain words belonging fundamentally to the scales of 5 and 20, without these systems having been completely elaborated. In the Roman and Babylonian systems 12 and 60 appear as bases. The New Zealanders have a scale of 11, their language possessing words for the first few powers of 11, and consequently 12 is represented as 11 and 1, 13 as 11 and 2, 22 as two 11's, and so on. (See NUMERATION.) What has been said concerning the development of the number symbols illustrates the power of a well-arranged number system and its necessity for progress in mathematical science. For reasons already stated, the world has generally adopted the decimal notation. In this system each place has a value ten-fold that of the place at its right, the general form of the integers being $10^a \cdot m + 10^{a-1} \cdot l + \dots + 10^0 \cdot d + 10^{-1} \cdot c + 10^{-2} \cdot b + 10^{-3} \cdot a$, and that of the fractions being $10^{-1} \cdot a' + 10^{-2} \cdot b' + 10^{-3} \cdot c' + \dots + 10^{-n} \cdot m'$. The decimal fraction was a relatively late development of the system. During the Middle Ages the sexagesimal fractions (see FRACTIONS), inherited from the Babylonians through the later Greeks, had been generally used by physicists and astronomers, and had therefore received the names 'physical' and 'astronomical fractions.' We have the remains of the system in our degrees, minutes, and seconds. The mediæval fractions were not limited to seconds, however, but extended to 'thirds,' 'fourths,' and so on. For example, $12^\circ 5' 3'' 16''' 18''''$ means in modern

symbols $12 + \frac{5}{60} + \frac{3}{60^2} + \frac{16}{60^3} + \frac{18}{60^4}$. To distinguish the fractions of trade from the 'fractiones astronomice,' the former were called 'fractiones vulgares,' from which come the English 'vulgar fractions' and the American 'common fractions.'

The constant advance of science, calling for larger numbers and more elaborate fractions, finally demanded some improvement on the sexagesimal system. As early as the latter part of the fifteenth century some indications of the approach of the decimal fraction are seen. During the sixteenth century several efforts were made in the same direction, notably that by Stevin (q.v.). But it was the advent of logarithms at the opening of the seventeenth century that made the necessity apparent and gave to decimal fractions a general recognition in the scientific world. It was, however, fully a century later that they began to be recognized in business; the establishment of the metric system (q.v.) and the decimal coinages of the various countries finally compelled their general use. A comparison of the three systems is seen in the following representation of one-tenth: $\frac{1}{10}$ (common), 0.1 (decimal), $\frac{1}{6}$ (sexagesimal).

Index notation may also be mentioned as a recent example of the power of symbolism. Astronomers and physicists, having to employ both exceedingly large and small numbers in calcula-

tion, find it advantageous in approximations to introduce powers of ten. Thus 284,000,000,000 may be expressed by $284 \cdot 10^9$, and 0.00000000035 by $3.5 \cdot 10^{-10}$. If these numbers are to be multiplied, the process is simply $284:3:5:10^{-10}$ or $994 \cdot 10^{-1} = 99.4$.

For the history and bibliography, consult: Treutlein, *Geschichte unserer Zahlzeichen* (Karlsruhe, 1875); and Cantor, *Geschichte der Mathematik* (Leipzig, 2 editions, 1880-98), both of which give extensive tables showing the development of the forms of the numerals.

NOTATION, MUSICAL. See MUSICAL NOTATION.

NOTE (OF., Fr. *note*, from Lat. *nota*, mark). In music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve, c ; minim, r ; crotchet, q ;

quaver, e ; semiquaver, f ; demisemiquaver, g ; and semi-demisemiquaver, h . Taking the

semibreve as a unit, the minim is $\frac{1}{2}$ its duration, the crotchet $\frac{1}{4}$, the quaver $\frac{1}{8}$, the semiquaver $\frac{1}{16}$, the demisemiquaver $\frac{1}{32}$, and the semi-demisemiquaver $\frac{1}{64}$. Notes of greater length than the semibreve were formerly in use—viz. the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these, the breve, b or c , is still sometimes met with in ecclesiastical music. According to their numerical proportions, it is customary to speak of notes as whole, half, quarter, eighth, sixteenth, etc. See LEADING TONE; MUSICAL NOTATION.

NOTE (in Law). See PROMISSORY NOTE.

NOTHING TO WEAR. A humorous poem by William Allen Butler (q.v.), which appeared anonymously in *Harper's Weekly* in 1857. The heroine is Miss Flora McFlimsey. Many editions of this popular satire on dress have been issued.

NOTHNAGEL, nôt'nä'gel, HERMANN (1841-1905). A German physician, born at Alt-Lietze-görücke. He studied medicine at Berlin, taught at Königsberg, Berlin, and Breslau, and was appointed professor at Freiburg (1872), at Jena (1874), and at Vienna (1882). Besides his *Topische Diagnostik der Gehirnkrankheiten* (1879), and *Beiträge zur Physiologie und Pathologie des Darms*, Nothnagel wrote *Handbuch der Arzneimittellehre* (1870; 7th ed. 1894), and contributions to *Spezielle Pathologie und Therapie* (1894 et seq.), of which he was an editor.

NOTHOMB, dō'tōn', JEAN BAPTISTE, Baron (1805-81). A Belgian statesman and diplomat, born at Messancy. He studied law at Liège, and entered politics in Brussels as a contributor to the *Courrier des Pays-Bas*. He played an important part in the Revolution of 1830, and in November of that year was appointed by the Provisional Government a member of the Diplomatic Committee. In 1837 he received the portfolio of Public Works, and in that department founded the Belgian railway system, and in 1842 became Minister of the Interior. He formed a new Cabinet in 1843, but his moderate policy was not long successful, and he was forced to retire by the coalition of 1845. He was Minister at Berlin from 1843 until his death. His chief works include *Essai historique et politique sur la révolution belge* (1833; 4th ed. 1876). Consult *Juste, Le baron Nothomb* (Brussels, 1874).

NOTICE (Lat. *notitia*, knowledge, idea, from *noscere*, to know). Notice in law denotes existing knowledge of a fact based upon information communicated by another, which knowledge has the effect of fixing the rights and liabilities of the party giving and the party receiving the information. The term is also sometimes applied to the act of giving the information which constitutes the notice. Unless otherwise stated, the term will here be used as first defined. Notice may be either (a) actual or (b) constructive.

Actual notice is knowledge of a fact based upon information communicated by either written or spoken language.

Constructive notice is knowledge which may not in fact exist, but which the law may presume to exist upon grounds of policy, as where notice to an agent is deemed to be notice to the principal, although in fact the information is never communicated to the principal; or where notice of pendency of action affecting real estate is constructive notice of the action to any one dealing with the title to the real estate, whether he has actual notice of the action or not (see *LIS PENDENS*); or where notice to the purchaser of negotiable paper of facts by which he is 'put upon inquiry' as to its validity may be constructive notice of a defense of the maker to any action founded upon the paper, or where one accepting a conveyance containing a reference to some other deed is deemed to have constructive notice of the other deed, although he may never have read it.

The doctrine of notice as a means of fixing rights and liabilities has many applications at common law, the more important of which are:

Liability of an indorser of negotiable paper, or of a promissory note, or a bill of exchange, is fixed by a notice of dishonor. The notice in order to charge an indorser must be given with due dispatch after dishonor or protest, usually on the day following; it must describe the bill or note and the nature of the dishonor. It may be oral, although usually in writing, and may be served personally or by mail. If the holder or prior indorser is unable after due diligence to find the indorser or serve him with notice, necessity of notice to charge the indorser is dispensed with. See *NEGOTIABLE INSTRUMENTS*.

In general any one purchasing property with actual notice of any equitable claims or rights that there may be with respect to the property, or with notice of facts sufficient to put him upon

inquiry, takes the property subject to such claims; as, for example, an equitable defense to negotiable paper, or fraud in the contract by which the vendee obtained title to the property, although a purchaser for value without notice would acquire the property free of claims. See *FRAUD*.

Notice by the landlord is necessary to terminate the tenancy of a tenant at will or by sufferance, or of a tenant from year to year. In the latter case the landlord must give notice at least a reasonable length of time before the end of any year of his election to terminate the lease. This time is now fixed by statute in some States. The landlord may, however, waive his right acquired by notice given, and continue the tenancy by expressly giving his consent, or by continuing to accept payment of rent.

When a creditor assigns his claim against his debtor without notice to the debtor, the debtor may pay the assignor and may thus discharge the debt. If, however, the assignee give the debtor notice of the assignment, the debtor is bound to pay the assignee; and if he pays the assignor, notwithstanding the notice to pay the assignee, he may nevertheless be compelled to pay the amount due to the assignee. See *ASSIGNMENT*.

The right of an insured to abandon the property insured to the insurer upon the happening of a partial loss is fixed by notice given by the insured to the insurer. If a proper case for abandonment, the mere giving of notice is sufficient. If not a proper case for abandonment, the insured may not abandon unless the notice is accepted by the insurer. See *INSURANCE*.

In addition to the various general rules of common law requiring notice to be given, notice may be required in special cases, as where statutes require notice to be given as a condition of fixing rights and liabilities; or where the parties to a contract stipulate expressly or impliedly for notice as a means of defining their rights under the contract.

Whether notice must be personally served upon the person to be notified depends upon the particular kind of notice. In general all notices, except those required in the course of litigation, must be personally served. Notice required between litigants may be served upon the attorneys in the case. When notice is required by statute, it must be served upon the person to be notified, unless otherwise specified in the statute. When the giving of notice is a condition precedent to creating a legal liability, a plaintiff seeking to enforce the liability must allege the giving of notice in his declaration or complaint. And in general it may be said that the party relying upon notice as a part of his cause of action or defense must plead and prove it. When, however, the condition is in the nature of a condition subsequent, it is not a part of the pleader's cause of action, and need not be pleaded by him. See *PLEADING*. Consult: *Wade, Treatise on the Law of Notice as Affecting Civil Rights and Remedies* (San Francisco, 1886); *Bennett, Treatise on the Law of Lis Pendens* (Chicago, 1887); and for the rules affecting notice in cases of motions in actions or proceedings at law, notices of protest of negotiable paper, etc., consult the authorities referred to under *PROCEDURE*; *PLEADING*; *NEGOTIABLE INSTRUMENTS*, etc.

NOTKER. The name of two monks of the Swiss Monastery of Saint Gall. **NOTKER BALBULUS** (c.840-912) did much for church music by perfecting the 'sequence' (q.v.). More than thirty melodies and about forty arrangements of words are ascribed to Notker, who was canonized in 1513.—**NOTKER LABEO**, the 'Thick-Lipped' (c.950-1022), was a great teacher, and it is probably to his school rather than to him individually that we should ascribe the many translations which bear his name. Among these are versions in German of Boëthius's *On the Consolation of Philosophy*, Aristotle's *Categories* and *Hermeutics*, and the Latin Psalter. These works have great value from the philological point of view as examples of Old High German. They are edited by Piper, *Notkers und seiner Schule Schriften* (1883-84). Consult Kelle, *Die Sankt Galler deutschen Schriften und Notker Labeo* (Munich, 1888).

NOTO, nō'tō. A city in the Province of Syracuse, Sicily, 17 miles southwest of the city of Syracuse, and three miles from the Mediterranean (Map: Italy, K 11). It is a handsome town with rich churches, beautiful palaces, and broad straight streets, and is the see of a bishop. Its academy has a library and a collection of antiquities. A trade is carried on in corn, wine, and oil. Noto was built in 1703 near the site of an older town of the same name (the ancient *Netum*), destroyed by an earthquake in 1693. Population (commune), in 1881, 18,239; in 1901, 22,564.

NOTOCHORD (from Gk. *νότος*, *nōtos*, back + *χορδή*, *chorḗ*, cord). A cellular, cartilage-like rod, arising in the embryo as an axial thickening of the hypoblast. It forms the basis of the vertebral column, i.e. the segmented axial skeleton of vertebrate animals. It is composed of a peculiar form of cellular tissue, called notochordal tissue, formed of large vacuolated cells extending from side to side of the notochord and having the nuclei confined to its dorsal and ventral regions. Around these tissues is a 'notochordal sheath' of connective tissue, which is produced dorsally into a canal for the nervous system. In all except the lower vertebrates, *Amphioxus* (q.v.), lampreys, sharks, and certain armored fishes, the notochord is a transitory embryonic structure, replaced later by the permanent vertebral column. Its presence in embryonic or adult structures is the primary characteristic of the phylum Chordata (q.v.); and the traces of it in ascidians, *Balanoglossus*, etc., led to the inclusion of those worm-like forms in this phylum as *Adelochorda* and *Urochorda*. See Plate of ASCIDIANS.

NOTOGÆA, nō'tō-jē'ā (Neo-Lat., from Gk. *νότος*, *notos*, south + *γαῖα*, *gaia*, earth). A term in zoogeography used as the name of a great faunal region in two different senses: (1) as embracing the whole Southern Hemisphere except Africa, and opposed to 'Arctogæa' or the Holarctic Region; and (2) as the equivalent of Neotropical Region (q.v.; see also DISTRIBUTION OF ANIMALS). The first use of the term was proposed by Huxley in 1868, to reconcile certain striking resemblances between Australasia and South America—such, for instance, as the presence of marsupials in both, and not elsewhere; he also applied the synonymical name *Austro-Columbian Region*. The implication of this collocation in the same category of two continents,

now so remote from one another, was that in ancient times there was a land-connection between them.

The secondary use of 'Notogæa' for South and Central America and the Antilles has not come into general use; nor has the term 'Dendrogæa,' proposed by Sclater.

NOTONECTA. See WATER-BUG.

NOTORNIS (Neo-Lat., from Gk. *νότος*, *notos*, south + *ὄρνις*, *ornis*, bird). A genus of large flightless rails or gallinules now nearly extinct. Only one living species is known, *Notornis Mantelli*, of the southern island of New Zealand, which was first described by Owen from remains found with those of various moas. A living specimen, however, was taken in 1849, a second in 1851, a third in 1879, and a fourth, now well preserved at Dunedin, New Zealand, in 1898. A second, purely white species, has become extinct within historic times on Norfolk Island, a single skin in Vienna being its sole remnant. See EXTINGUISHED ANIMALS; FLIGHTLESS BIRDS.

NOTOSUCHUS, nō'tō-sū'kūs (Neo-Lat., from Gk. *νότος*, *notos*, south + *σούχος*, *souchos*, sort of crocodile). A small unarmored crocodile found fossil in Patagonian formations regarded as of Cretaceous age. It had a short, broad skull, blunt nose, mesosuchian palate, and the teeth few, small (except the unusually large canines), and laterally compressed.

NOTOTHERIUM (Neo-Lat., from Gk. *νότος*, *notos*, south + *θηρίον*, *thērion*, diminutive of *θηρ*, *thēr*, wild beast). A fossil marsupial mammal of the suborder Diprotodontidæ, found in the Pleistocene beds of Australia. See DIPROTODON; and MAMMALIA.

NÔTRE, nō'tr', **ANDRÉ LE.** A French architect and landscape gardener. See LE NÔTRE, **ANDRÉ.**

NOTRE DAME (nō'tr' dām) **DE PARIS,** CATHEDRAL OF. A church in Paris, the most celebrated among the many churches dedicated to the Virgin in France. It is situated on the Ile de la Cité. The remains of a temple of Jupiter Cernunnus and the image of a horned god were found on the spot about 375, when a church was erected on the same site. In the sixth century there were two churches there, dedicated to Saint Stephen and the Virgin. Childebert rebuilt the latter about 520 in a Roman style, considered very grand. The first glass window now known of in France was placed in it. Fragments of mosaic and precious marbles supposed to be from the floor and columns of this church were discovered in excavations in 1847, and are now in the Musée de Cluny. This church was pillaged and partly destroyed by the Normans in 857, but it was repaired by Bishop Anseric. In 1140 the Abbé of Saint Denis put in a glass window of great beauty. It was then called the *église neuve*, to distinguish it from Saint Etienne, called *le vieux*. In the twelfth century both were falling into ruins, though they had for centuries been used for the great religious ceremonies and royal pageants of France.

About 1160 Bishop Maurice de Sully resolved to replace both old churches with a single edifice worthy of the capital of the kingdom, and in 1163 the foundation of the present majestic pile was begun, its corner stone being laid by Pope Alexander III., then a refugee in France. The choir was the first part begun and the work was pushed

CATHEDRAL OF NOTRÉ-DAME, PARIS

rapidly, so that in 1182 the great altar was consecrated by a legate of the Pope. In 1185 Heraclius, Patriarch of Jerusalem, came to Paris to officiate with the Bishop in the dedication of the choir. Henry II., King of England, was interred before its high altar in August, 1189. The choir, transepts, and adjoining bays of the nave were completed in about 1196. The lower part of the nave was then run out to the main façade, which, with its two towers and three portals, was only begun by Bishop Pierre de Nemours in 1208. The portal of the south transept façade was built still later, as shown by an inscription of the architect Jean de Chelles, who began work upon it in 1257, in the reign of Saint Louis. The chapels in the rear of the transepts were not a part of the original design, and were added in the last part of the thirteenth century, about which time, also, the towers of the west front were completed. In 1699 Louis XIV. was seized with the ambition to place in the cathedral an altar piece in the Renaissance style, and removed the original altar to give place to it. Other alterations were made by Soufflot in 1771-78. During the Revolution the statues of the old kings of France, which were upon the gallery of the main façade, were destroyed, and in 1793 the cathedral became, by law of the Revolutionists, the Temple of Reason. Victor Hugo's literary masterpiece, *Notre Dame de Paris* (1830), attracted popular attention to the venerable edifice, and in 1845-55 it was subjected to a thorough and successful restoration, under the architects Lassus and Viollet-le-Duc. From 1182 to the present its nave, its altars, and its chapels have been the scenes of the most important ceremonies of Church and State in France.

The architecture is the noblest expression of simple early Gothic before its richer flowering in Amiens, Rheims, and Bourges cathedrals, and for simple majesty of expression its façade has no superior in France. The plan of Notre Dame is exceedingly compact; there is no break in the line of radiating chapels in the choir and the transepts do not project beyond the chapels. The inner narthex, of a double bay, is beneath the line of towers; the body of the church consists of a high central nave and four aisles flanked by an outer continuous line of chapels and cut by transepts almost in the centre. The vaulting is superb. The early features of sex-partite vaulting, heavy round pillars, and high triforium gallery characterize the interior. The beginnings of tracery are illustrated by its lack in the earliest parts at the choir end and in its use in simpler forms in the windows and details of nave and façades. The portals, instead of being, as in the more developed cathedrals, projected from the façade, are recessed in its mass, and of their rich sculptures, one tympanum is an interesting survival of the earlier church (c.1140), the rest, barring restorations, dating from between 1215 and 1225. The extreme length of the cathedral is 430 feet; width at transept, 170 feet; across nave and aisles, 124 feet; area covered by it, 64,108 square feet; height of towers, 223 feet; height of vault, 108 feet.

NOTRE DAME DU LAC, du lak, UNIVERSITY OF. A Roman Catholic institution at Notre Dame, Ind., founded in 1842 and chartered in 1844. The university comprises schools of arts and letters, science, engineering, pharmacy, archi-

ecture, and law, and a large preparatory department. In 1902 a branch was established at Portland, Oregon, under the name of Columbia University. There are other branches at Austin, Tex., New Orleans, La., Cincinnati, Ohio, and Watertown, Wis. In 1902 the faculty numbered 70, and the attendance was 872, of whom 348 were preparatory students. The library contained 60,000 volumes. The college property was valued at \$2,700,000, of which sum \$2,200,000 was represented by the buildings and grounds.

NOTT, ELIPHALET (1773-1866). An American educator. He was born at Ashford, Conn., June 25, 1773. He was left an orphan at an early age, and had to earn his own support while striving for an education. Nevertheless he received the degree of M.A. from Brown University in 1795, and the same year was licensed to preach. He was missionary and school teacher at Cherry Valley, N. Y., in 1796-97, and pastor of the Presbyterian church in Albany (1798-1804). In the latter year he was elected president of Union College at Schenectady, N. Y., and filled the position for more than sixty-two years. He found the college without funds, buildings, or library, and in debt, but he soon provided for its needs, and during his presidency more than 4000 students were graduated. He possessed no small mechanical genius, and among about 30 patents granted to him was one for the first stove to burn anthracite coal. He was considered one of the most finished pulpit orators of his time. Besides sermons, addresses, etc., he published *Counsels to Young Men* (1810) and *Lectures on Temperance* (1847). Consult his *Life* by Van Santvoord, revised by Tayler Lewis (New York, 1876).

NOTT, JOSIAH CLARKE (1804-73). An American physician and ethnologist, born in Columbia, S. C. He graduated at the South Carolina College in 1824, and at the medical school of the University of Pennsylvania three years later. After practicing for a time in Columbia, he went in 1835 to Europe, and spent a year in the hospitals of Paris. On his return he settled at Mobile, where in 1858 he founded a medical school, which became a part of the University of Alabama. He served for a time on the staff of General Bragg during the Civil War. He was much interested in ethnology and kindred sciences, and published, besides many contributions to medical journals and other periodicals: *Two Lectures on the Connection Between the Biblical and Physical History of Man* (1849); *The Physical History of the Jewish Race* (1850); *Types of Mankind* (1854); and *Indigenous Races of the Earth* (1857). The last two books he wrote in conjunction with George R. Gliddon (q.v.), an English scientist, and one of the aims of the authors was to disprove the unity of the human race. Some of Nott's theories have been severely criticised, and they are perhaps more original than profound.

NOTTEBOHM, nôt'te-bôm, GUSTAV (1817-82). A German musician and writer, born at Lüdenscheid, Westphalia. After he had studied for a year in Berlin with Berger and Dehn, he went to Leipzig (1840), where he became the friend and pupil of Mendelssohn and Schumann. He then studied under Sechter in Vienna (1846), and afterwards taught music himself in that city. He became famous through his editions of musi-

cal classics, and his critical reviews of the lives and works of great composers, notably Beethoven. His publications include: *Ein Skizzenbuch von Beethoven* (1865); *Thematisches Verzeichnis der im Druck erschienenen Werke von Beethoven* (1868); *Beethoveniana* (1872-87); *Beethovens Studien* (1873); *Thematisches Verzeichnis der im Druck erschienenen Werke Franz Schuberts* (1874); *Mozartiana* (1880); and *Ein Skizzenbuch von Beethoven aus dem Jahre 1803* (1880).

NOTTINGHAM, nôt'ting-am. An inland county of England, between Lincolnshire on the east and Yorkshire and Derbyshire on the west (Map: England, E 4). Area, 826 square miles. The eastern portion is comparatively level, the western undulating; in the south are the upland moors and pasture lands, and in the west are remains of the royal forest of Sherwood. The soil is fairly productive; the agricultural industries include market gardening and hop-raising. There are important domestic manufactures and some coal-mining. The principal river is the Trent, connected by canals with the Witham. Population, in 1891, 445,823; in 1901, 514,537. Capital, Nottingham.

NOTTINGHAM. A municipal borough and county, the capital of Nottinghamshire, England, on the Leen, at its junction with the Trent, 130 miles north-northwest of London (Map: England, E 4). It is built principally on the slope and at the foot of a rocky eminence crowned by an ancient castle. The market place, 5½ acres in extent, is surrounded by fine buildings. The Exchange, the town and county halls, the house of correction, Saint Mary's Church, the Roman Catholic Chapel, the new free grammar school, erected in 1868, and the University College, with its fine buildings, are edifices worthy of special mention. The free grammar school was founded in 1513. There are numerous hospitals for the poor and infirm, a public park of 150 acres, a common, called Bulwell Forest, of 135 acres, and a fine arboretum of 17 acres. The municipality owns property which returns a revenue of \$150,000 yearly, namely, the water, gas, and electric lighting plants, markets, free libraries, baths, cemeteries, parks, garden allotments, tramways, artisans' dwellings, hospitals, lunatic asylums, and a large sewage farm. It is the sole municipality in England that maintains a university college. Connected with the college are well-equipped technical schools, including an agricultural department and a natural history school. It is one of England's leading educational institutions. In 1874 the town acquired Nottingham Castle and installed art galleries and a museum. Nottingham is an important industrial centre, the principal manufactures being bobbinet and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, iron, wire, bicycle, basket, brass, and bleaching works are in operation. Formerly the city was noted for its manufactures of woollens.

As the Snottengaham, 'home of the caves,' of the Saxons, the place first became important in the ninth century. It was one of the five Danish boroughs. Nottingham Castle was built by William the Conqueror, and was the seat of parliaments and other important historical events. Charles I. set up his standard at Nottingham, and the castle was held at times by both Royalists and Parliamentarians. It was dismantled by Cromwell in

1644, rebuilt after the Restoration, and suffered severe damage from fire during the Reform Bill riots of 1831. Nottingham has been a manufacturing town for over 600 years. Its oldest charter, dated 1155, confirmed privileges granted by former kings. Its latest royal charter of 1897 conferred the rank and title of city under the designation of "City of Nottingham, and the County of the same City," in commemoration of Victoria's diamond jubilee. Nottingham is the seat of a suffragan bishopric to Lincoln, and of a United States consulate. It sends three members to Parliament. Population, in 1851, 57,400; in 1891, 213,900; in 1901, 239,750. Consult Bailey, *History of Nottinghamshire* (London, 1853-65).

NOTTINGHAM, HENEAGE FINCH, Earl of (1621-82). An English lawyer and statesman, the son of Sir Heneage Finch, Speaker in Charles I.'s first Parliament. He was educated at Christ Church, and then studied law. He sat in the Convention Parliament, and in 1660 he was appointed Solicitor-General and created a baronet. In religious affairs he was a conservative, insisted on the maintenance of bishops as a part of the Church establishment, and opposed all toleration of dissenters. In 1670 Finch became Attorney-General, and from 1673 to 1676 he was Chamberlain of Chester. Having gradually become the spokesman of the Court in the House of Commons, he was appointed on November 9, 1673, Lord Keeper of the Seals, and the following year was raised to the peerage as Baron Finch of Daventry. The same year he resigned as Lord Keeper of the Seals to become immediately Lord Chancellor, and as such presided over the many important political trials of the day. On May 12, 1681, he was created Earl of Nottingham. He died December 18, 1682. In a time of violent partisanship Finch is remarkable in that in his long career he never was attacked by either the Court or Parliament, and always enjoyed the full confidence of both, though he was chairman of nearly every important committee while he sat in the House of Commons.

NOTTOWAY. An Iroquoian tribe, formerly living upon the river of the same name in southeastern Virginia. In language and alliances they were closely connected with the Tuscarora of North Carolina. When the English first occupied Virginia, the Nottoway seem to have been one of the strongest tribes in the region, but in the later colonization period they were already hastening to swift decay. In 1701 they occupied a palisaded village on the west bank of the river, where they still numbered about 500 souls in 1722. In 1785 they held a reservation of 27,000 acres, very little of which, however, was under cultivation. In 1825 there were still 47 persons bearing the name, although their blood was probably more negro than Indian.

NOTUS (from Gk. *notos*, south). The southwest wind, called by the Romans *Auster* (q.v.).

NOUMÉA, nōō-mā'ā. The capital of New Caledonia, situated near the southern extremity of the island (Map: Australasia, J 5). It is a railroad terminus and has a good harbor. The population, in 1898, was 6968.

NOUN (OF. *nom*, *nom*, Fr. *nom*, from Lat. *nomen*, name; connected with Gk. *ὄνομα*, *onoma*, Ir. *ainm*, OPruss. *emnes*, OChurch Slav. *imen*, Goth. *namo*, OHG. *namo*, Ger. *Name*, AS.

neme, Eng. *neme*; and probably ultimately with Lat. *nocere*, *noocere*, Gk. *γινώσκω*, *gignōskein*, Skt. *jāṣ*, AS. *onāwen*, Eng. *know*). In grammar, a word denoting a thing. Of the eight so-called parts of speech (see GRAMMAR) the noun is one of the four primitive ones, the other three being the interjection (q.v.), pronoun (q.v.), and verb (q.v.). The noun is sharply distinguished both from the verb and from the pronoun, not only by its function, but by its inflection (q.v.), although the pronoun and noun show frequent similarities, and in certain languages, as in Hottentot and in the Polynesian dialects, the noun and the verb coincide in form. Traces of these points of contact survive in Semitic and Indo-Germanic, especially in the verbal nouns, i.e. the infinitives, which are nouns in form and verbs in force. Moreover, in the Indo-Germanic languages there are many instances in which, on account of the similarity of function of nouns and pronouns, pronominal inflection has been extended by analogy (q.v.) to the nouns and nominal inflection to the pronouns. Nouns are inflected for gender (q.v.), number, and case. Conventionally they are divided into common, proper, abstract, and collective. Common nouns denote material, concrete things, as *table*, *cat*; proper nouns denote particular individuals and personifications, as *John*, *Liberty*; abstract nouns denote qualities, as *goodness*, *pleasure*; and collective nouns denote masses of units, as *army*, *bundle*. This classification is valuable in certain grammatical and logical analyses, but from a philological point of view it is worthless. It should also be noted that in many instances the adverb (q.v.), and by implication the preposition (q.v.) and conjunction (q.v.), were originally a stereotyped case-form of a noun, as in the French adverbial suffix *-ment*, which is derived from the Latin *mente*, ablative of *mens*, mind, as *amiablement*, 'amiably,' from Latin *amabili mente*, 'with lovable spirit.' Consult: Fr. Müller, *Grundriss der Sprachwissenschaft*, vol. i., part i. (Vienna, 1876); Brugmann, *Vergleichende Grammatik der indogermanischen Sprachen*, vol. ii. (Strassburg, 1889-92); Delbrück, *Vergleichende Syntax der indogermanischen Sprachen*, vol. i. (ib., 1893); Zimmern, *Vergleichende Grammatik der semitischen Sprachen* (Berlin, 1898); Audouin, *Déclinaison dans les langues indo-européennes* (Paris, 1898).

NOUVELLE FRANCE, nōv'vèl' frāns (Fr., New France). The early name of Canada.

NOUVELLE HÉLOÏSE, a'lō'èz', LA. See JULIE.

NOVAULITE (from Lat. *novacula*, razor, from *novare*, to renew, from *novus*, new; connected with Gk. *neos*, Skt. *nava*, OChurch Slav. *novŭ*, Ir., Gael. *nuadh*, Goth. *niujis*, OHG. *niwi*, *niwui*, Ger. *neu*, AS. *nāwe*, Eng. *new*). The name given to a fine-grained rock composed of minute quartz particles—probably a consolidated siliceous ooze. A variety of novaculite called 'Arkansas stone,' from its occurrence in Arkansas, is much used for whetstones.

NOVAIA PRAGA, nōv'vā-yā prā'gā. A town in the Government of Kherson, South Russia, situated about 200 miles north of Kherson (Map: Russia, D 5). It carries on some trade in timber, and had a population of 12,400 in 1897.

NOVÁKOVIC, nō-vā'kō-vich, STOJAN (1842 —). A Servian statesman and philologist, born at Shabatz, and educated at the University of Belgrade. In 1871 he was chosen professor of Servian philology in the University of Belgrade. Between 1873 and 1883 he was three times Minister of Education, in which post he reorganized Servian education; and in 1886 resigned from the Ministry of Interior, which he had occupied for two years, and received the appointment of Minister to Turkey, which he held until 1892. From July, 1895, to December, 1896, he was Prime Minister and Minister of Foreign Affairs, and then became once more Minister to Turkey. In 1900 he was transferred to Saint Petersburg. He wrote *Istoriya srpske književnosti* (1867) and a Servian grammar (1879).

NOVALIS, nō-vā'lis (Lat., fallow land). A name assumed by Friedrich von Hardenberg (1772-1801), a German romantic author, once of cosmopolitan renown. He was born in Prussian Saxony. His parents were Moravians, and he was much influenced by that mystic religion. He studied at Jena, Leipzig, and Wittenberg, and in 1794 went to Tennstädt to further his legal training. There he fell in love with a delicate thirteen-year-old girl, who died as his betrothed in 1797. Novalis was then auditor at the Weissenfels salt works. He thought he was a blighted being, but presently he went to Freiburg to continue technical studies and became again betrothed. He returned to Weissenfels in 1799, but was obliged by disease of the lungs to postpone his marriage and died in 1801. His writings were soon collected by the Schlegels and issued in two volumes, often reëdited, with a third volume in 1846. They are mainly fragmentary. Noteworthy among them is an unfinished romance, *Heinrich von Ofterdingen*, the mawkish Knight of the Blue Flower Poesy, whose 'apotheosis' Novalis tells us he intended the novel to be. Carlyle recommended its 'persual and reperusal.' Individual passages in it are charming, and good lyrics are interspersed in the narrative. Earlier in time than *Ofterdingen* is a romance, *Die Lehrlinge zu Sais*, wherein the 'Disciples' discover that "the secret of Nature is nothing else than the fulfilled longing of a loving heart." Famous also in their way are the *Hymnen an die Nacht*, sentimentally morbid musings on his quickly consoled bereavement, mingled with impressions of Young's *Night Thoughts* and Fichte's lectures at Jena. Some of the fragments are political and reveal an exaltation of patriotic idealism. Other fragments deal with natural science in the same dreamy spirit. His religious lyrics have an emotional tenderness and a nebulous charm. The rest of his work is all but forgotten. Consult: Haym, *Friedrich von Hardenberg* (2d ed., Gotha, 1883); id., *Die romantische Schule* (Berlin, 1870).

NOVARA, nō-vā'rā. The capital of the Province of Novara, Italy, and a railway centre, 30 miles west of Milan (Map: Italy, C 2). It commands fine Alpine views from the boulevards on the site of its dismantled fortifications, and has several notable churches, chief of which are the Romanesque cathedral, dating from the fourteenth century, and rebuilt between 1860 and 1870, with its fine frescoes and sculptures and grand high altar, and the Church of San Gauden-

zio, surmounted by a high dome. The city has a lyceum, museum, and bishop's seminary, with a library of 30,000 volumes. The principal industries are the spinning of silk, cotton, and linen cloths, weaving, and dyeing. The town is the centre of a fertile district, producing grapes, rice, and corn. Population (commune), in 1881, 33,077; in 1901, 45,248. Novara is the ancient Novaria. The town passed successively into the possession of Milan, Spain, Austria, and Sardinia. It was the scene of a battle March 23, 1849, between the Sardinians and the Austrians, which resulted in the complete defeat of the Sardinians, and led to the abdication of Charles Albert in favor of his son, Victor Emmanuel.

NOVA SCOTIA, nō'vā skō'shā. A province of the Dominion of Canada, bounded on the northwest by New Brunswick and the Bay of Fundy, on the north by the Strait of Northumberland (separating it from Prince Edward Island) and the Gulf of Saint Lawrence, and on the other sides by the Atlantic Ocean. It consists of two portions, Nova Scotia proper (a large peninsula connected with New Brunswick by an isthmus about 15 miles in width) and the island of Cape Breton (q.v.). The peninsula, about 280 miles in length, and from 50 to 100 miles broad, extends in a northeast and southwest direction. Cape Breton lies northeast of Nova Scotia proper, and is separated from it by a narrow strait called the Gut of Canso, 16 miles long and from half a mile to two miles wide. Sable Island (q.v.) is a dependency of the province. The area of the province is 20,600 square miles.

TOPOGRAPHY. The surface of Nova Scotia is undulating, and traversed by broken ranges of hills, whose direction is in general that of the long axis of the province. The direction of these uplifts, together with their rock-formation, identifies the region as a part of the Appalachian system. The highlands of the province may roughly be grouped into three sections: first, those running along the Atlantic coast, constituting the backbone of the peninsula, and forming a wide plateau narrowing to the northeast, where they represent the projection of Cape Canso; second, the Cobequid Hills, which form the isthmian projection into the Bay of Fundy, and run thence southeast, until, in the eastern end of the peninsula, they meet the first named range; third, a very narrow and detached range of trap rock on the coast of the Bay of Fundy, separated from the main plateau by Saint Mary's Bay and the valley of the Annapolis River.

The great plateau of the peninsula seems to have been originally a vast upheaval of Devonian age, probably as high as 10,000 feet. This has been denuded by the action of wind and water to its present condition of a peneplain not more than 600 to 1000 feet high. Some residual hills of hard rock have been left, and in many places the igneous granite core of the former mountain has been laid bare. The remaining rocks covering the core on either side belong chiefly to the Cambrian system, especially along the eastern coast. There are some outcroppings of the Algonkian group, and along the northern and western edge of the plateau there are remnants of highly fossiliferous Devonian and Upper Silurian strata. The triassic lowlands to the north and west of the plateau

around the Basin of Minas were probably formed by submarine denudation. They are underlaid by very thick strata of Carboniferous rock. The Cobequid plateau, which rises from the midst of these lowlands, has lately been shown to be of late Devonian origin.

The greater portion of the province drains to the southward, through numerous short rivers. Small lakes are also numerous, Lake Rossignol in the south being the largest on the peninsula. The large body of water in Cape Breton Island, called Bras d'Or Lake, is more properly an inland sea.

CLIMATE. The insular position of Nova Scotia renders its climate different from that of the other Canadian provinces. For instance, it is not subject to great extremes of heat and cold, but has, on the other hand, a larger amount of cloudy and foggy weather. The presence of the gulf current off the south coast lessens the severity of the winters, and the interior portions of the province are greatly protected by the ranges of hills which border the coasts. The northern hills are especially useful in warding off the north winds, and the range which borders the Bay of Fundy protects the Annapolis Valley from the winds and fogs, which are common to the bay region. The temperature seldom falls below zero, and the summer maximum in the region of Halifax (latitude 44° 38' N.) is about 86°, being somewhat higher than this in the interior. The annual precipitation averages about 45 inches.

MINERALS. The province is rich in mineral resources, and mining is a growing industry. The Carboniferous rocks of Northern Nova Scotia and Cape Breton Island contain coal seams of great thickness, the coal being a superior quality of the bituminous variety, and well adapted for coking. From 1890 to 1898 the annual production fluctuated between two and three million tons, but exceeded the latter figure in 1899 and 1900. This exceeds the combined production for all the rest of Canada, and constitutes the main source of supply for the Maritime Provinces. Gold is found in the quartzites and slates of the Cambrian Age that parallel the Atlantic coast of the peninsula. The vein ores (they have been worked since 1860) were formerly very rich, but have now become nearly exhausted. However, conditions favor a minimum cost of mining and milling the coarser gold ores, and they are being rapidly exploited. Prior to 1897 the product had fluctuated under \$500,000 in annual value, but rose to over \$600,000 in 1899 and 1900. Rich deposits of iron ore are found. Only small quantities of iron ore are now being mined, but the possibilities are great. Small quantities of gypsum and manganese are mined in Cape Breton Island, and antimony is exported from the region north of Halifax.

FISHERIES. Fishing is one of the leading industries. The province surpasses all other provinces and States of the continent in the annual value of its fish output. For a long period the value of this output has run from \$6,000,000 to \$8,000,000. The catch includes deep sea, inshore, and river varieties. The first two, however, are most important. Sea-fishing is encouraged by a bounty offered since 1882 by the Dominion Government. About two-thirds of it—\$100,000—has gone annually to the 18,000 Nova Scotia fishermen. The cod and lobster fisheries surpass in

importance, the annual product being about \$2,500,000 and \$1,500,000 respectively.

AGRICULTURE AND GAME. The valley lands of Nova Scotia are exceedingly fertile. Even the reckless method of cultivation often indulged in has failed to exhaust this fertility. The hill lands are more rocky and less fruitful. The flora is much the same as is found in other sections of Canada south of the Saint Lawrence. As a result of its somewhat insular climate, however, a few species are found which are unknown in other parts of the continent. Forests originally covered the greater portion of the province, the varieties of trees being well divided between the hard and soft woods, the former being more common in the protected valleys. At many points the original forests have been removed, resulting in a noteworthy climatic change—noteworthy because different from that which usually follows forest removals—namely, the moist coast air gains a more easy access to the interior, increasing the degree of moisture of both atmosphere and soil. Tamarack, spruce, balsam, and other soft woods have taken the place of the beech, maple, elm, walnut, and other hard woods, where these have been removed. Furthermore extra drainage is required and the agricultural industry has been materially modified.

The per acre yield of almost every crop raised is scarcely exceeded in any part of the continent. The cultivation of the soil, however, is confined to the valleys and has not more than held its own for a long time. Oats and potatoes are the most favored crops; hay, barley, wheat, buckwheat, and rye are next in importance. The root crops—especially turnips—receive much attention. The greatest agricultural activity centres in the protected Annapolis and Cornwallis valleys, which have become renowned for their production of fine fruits. Fruit-raising is receiving increased attention, and apples constitute one of the principal articles of export, their reputation having been won both by virtue of their flavor and their keeping qualities. The broken land is well adapted to grazing and the usual varieties of domestic animals are bred. Cattle, however, are the only species which has received much attention. Cattle were formerly raised chiefly for the butcher, but more recently for dairy purposes. The butter and cheese products are becoming important sources of revenue, and dairy farming will apparently control the industrial activity of the future.

In many districts birds and wild animals—bears, foxes, wolves, deer, and smaller varieties—are in sufficient numbers to afford excellent hunting.

MANUFACTURES AND TRANSPORTATION. The maritime situation of Nova Scotia is most favorable for purposes of trade with European and Atlantic seaboard States. The coast line (about 1000 miles long) has an unusual number of indentations, which offer exceptional harbor facilities. The harbors on the Atlantic and the Bay of Fundy coasts are accessible the year round. Halifax (q.v.), on the Atlantic coast, is the harbor most frequented. The registered vessels built by the province number 155 steamers and 1966 sail boats. The tonnage for both the over-sea and coastwise vessels which enter and leave the harbors is rapidly increasing, amounting in 1900 to a total of 3,700,000 and 6,000,000 respectively. The Intercolonial Railroad, with termi-

nals in Halifax on the east and in Sydney on the north coast, connects Nova Scotia with the other Canadian provinces. Other lines traverse the southern part of the peninsula, making a total of 943 miles for the province in 1901. As in the other provinces, Government subsidies have greatly aided in railroad construction. The largest items of export are fish, coal, lumber, and minerals, while the imports consist largely of West India produce and British and American manufactured products.

No industry of the province has so bright a prospect as manufacturing. Aside from ship-building, which has greatly declined, manufacturing has never been important. Nova Scotia has the exceptional advantage at home of the iron ore, coal, and limestone (used as flux), and therefore seems destined to be a seat of iron and steel manufacturing industries. Coke is being manufactured, and at Sydney in Cape Breton the iron and steel industry is being developed on an extensive scale. The forests afford a large supply of tanning barks. This has given rise to the tanning industry. Another natural advantage to manufacturing is the great water power afforded by the streams of the province. There are a number of cotton mills. Sugar is manufactured at Halifax. Extensive fruit-raising explains the number of canning factories. Butter and cheese factories are increasing in number.

BANKS. In 1899 the chartered bank branches numbered 69. The clearing-house transactions in Halifax in 1900 amounted to \$77,600,000. The post-office savings banks numbered 56 (1900), with 13,125 depositors and an average deposit of \$261.44. There were also (1900) 15 Government savings banks, having 15,479 depositors, with an average deposit of \$306.64.

GOVERNMENT. Nova Scotia was incorporated with the Dominion of Canada in 1867, and is represented in the Canadian Parliament by 10 Senators and 20 members of the Lower House. It has also its own local Legislature and a Lieutenant-Governor. This official is appointed by the Governor-General of the Dominion and his Council. The Legislature consists of a Council and a House of Assembly elected by the counties—which are 18 in number—and by the cities, the municipal units of government being counties and towns. The people elect a county council—each polling district having one representative—which in turn appoints the other county officers. It is necessary to secure the sanction of the people in order to borrow money, and the Lieutenant-Governor of the province has a right of veto upon the money-borrowing powers, as well as the by-laws passed by the Council. The capital of the province is Halifax.

The principal sources of revenue for the Provincial Government consist of the Dominion subsidy of about \$432,000 annually and the mine royalties. These royalties are becoming almost as great as the Dominion subsidies. The total receipts for 1900 exceeded \$1,000,000, and the expenditures were \$937,000. The same year the net debt of the province amounted to \$2,713,000.

In 1900 the charitable institutions cost the province \$128,000. These consist of a deaf and dumb institution, a blind institution, a general hospital, and 24 poor-houses. Persons sentenced for crime are sent to the Dominion penitentiary, maintained for the Maritime Provinces at Dorchester, N. B.

POPULATION. The returns of the population for 1891 and 1901 were respectively 450,306 and 459,574. Nearly all of the inhabitants are of British origin, the Scotch being in the majority. There is not so much unoccupied territory as in the other provinces (excepting Prince Edward Island), and the density of population—22 per square mile—is accordingly greater. Halifax, the seventh largest city of the Dominion, had a population in 1901 of 40,700. Sydney, in Cape Breton Island, had a population of 9900, a gain of 75 per cent. during the decade.

RELIGION AND EDUCATION. While the Catholic Church is numerically the strongest, it contains but a little over one-third of the church following in the province. The Presbyterians, Baptists, Episcopalians, and Methodists follow in the order named. The great interest in education is shown by the fact that 1 out of every 4.4 of the population attends school. The schools are free and undenominational; there are no separate Catholic or Protestant schools maintained by the public system, as in Ontario and Quebec. The members of the Executive Council constitute the Council of Public Instruction, which, together with the Superintendent of Education, is at the head of the school system. The schools are carefully superintended, and gradation and uniformity of methods are generally maintained. There is one academy in each county. The province maintains a normal school, but no university. The total cost of the school system in 1901 was \$8.58 per enrolled child. About two-fifths of this is borne by Government grants and municipal aid, the rest by local taxation. The following are the denominational colleges: Acadia University, at Wolfville (Baptist); King's College (Episcopalian), at Windsor, the oldest chartered university in Canada; Saint François Xavier College, and Saint Anne's College (Catholic); and Dalhousie University, at Halifax—the last being undenominational, but receiving the support of the Presbyterian Church.

HISTORY. Nova Scotia is believed to have been first discovered in 1497 by John Cabot, who sailed under the English flag. It is probable that the Portuguese navigator Cortereal explored the coast in 1500. The first settlers, however, were the French, who took possession of the country in virtue of the explorations of Verrazano, Cartier, the Marquis de la Roche, and Champlain. French fishermen frequented this locality, and in 1598 Henry IV. of France granted Acadia, as the country was called, to De la Roche. In 1604 the first settlement was made by the Sieur de Monts, Samuel de Champlain, and the Baron de Poutrincourt on the island of Saint Croix. This was removed in the following year to Port Royal (Annapolis). Throughout the French tenure the colonists of New England made attempts to obtain possession of the country, and in 1621 Sir William Alexander (q.v.) obtained from James I. of England a grant of Acadia, which was now named Nova Scotia. In 1710 the English captured Port Royal, and in 1713, by the Treaty of Utrecht, France gave up its claim to the country, except to Cape Breton or Isle Royale, which was ceded in 1763. In order to destroy the French influence, which continued to predominate, the English Government in 1755 deported a large number of the French Acadians, estimated at more than 6000 (probably about half of the total population of French descent), and scattered

them among English colonists from Massachusetts to Georgia. This act forms the theme of Longfellow's *Evangeline*. A blow was also struck at the French influence by the founding in 1749 of Halifax, which became a distinctly English centre. The development of the country was greatly aided by the arrival of Scotch settlers and by the large number of loyalists who left the United States at the time of the Revolution. Until 1758 the control of the colony was almost completely in the hands of the Governor appointed by the King, but in that year the first Legislature was created. The country increased in population to such an extent that in 1784 the Province of New Brunswick was formed from a part of its territory. The history of Nova Scotia since 1784 forms a part of the general history of Canada (q.v.).

Consult: Haliburton, *Papers on the History and Resources of Nova Scotia* (Halifax, 1862); Dawson, *Handbook of the Geography and Natural History of Nova Scotia* (6th ed., Pictou, 1863); Selwyn and Dawson, *Descriptive Sketch of the Physical Geography and Geology of the Dominion of Canada* (Montreal, 1884); *Nova Scotian Institute of Science Proceedings and Transactions* (Halifax, 1870 et seq.); Morley, *Record of Travel in Nova Scotia* (New York, 1900); and the authorities referred to under CANADA.

NOVATI, nò-và'tè, FRANCESCO (1859—). An Italian philologist, born in Cremona. He was made professor at the Academy of Milan in 1883, and went thence to Palermo (1886), to Genoa (1889), and to Milan (1892). By the establishment of the *Giornale storico della letteratura italiana* (1883, with Graf and Renier), and by constant contributions to the *Giornale storico* and the *Studj di filologia romanza*, he did much to spread the knowledge of his special branch of study throughout his own country and Europe. He devoted his attention especially to the Renaissance. A number of his critical essays are collected in the volume *Studj critici e letterari* (1889). He also published the *Correspondence of Coluccio Salutati* (1891-96).

NOVATIAN. A Roman presbyter of the third century, noted chiefly for the schism to which he gave his name. According to a late account, he was born in Phrygia, but it is more probable that he was a native of the West. He was converted in mature life, during an illness, and received only 'clinical' baptism (an incomplete form of the rite, sometimes administered to the sick), which was afterwards charged against him as a canonical defect, yet did not hinder his ordination to the priesthood. During the vacancy in the Roman See caused by the Decian persecution (250-251), when the presbyters directed the affairs of the Church, Novatian quickly assumed the leadership among them. It was he who wrote two of the letters addressed by the Roman clergy to Cyprian. In the discussion about the lapsed (i.e. apostates in the persecution), Novatian insisted upon excluding them from fellowship, in opposition to the milder discipline advocated by the newly elected Bishop, Cornelius. Many of the clergy sympathizing with Novatian, he was put forward as rival bishop, whereupon he was pronounced schismatic by a Roman synod, and excommunicated (251). This action, however, failed to check the movement he had inaugurated. The Novatianists, or

Cathari, as they were called (i.e. *the pure*), displayed increasing strength, and churches of their order sprang up all the way from Spain to Asia Minor. In Africa they were especially strong. They flourished for a long time, and traces of them are found as late as the seventh century. Of Novatian's end little is known. A late account (by Socrates, fifth century) says that he died a martyr in the reign of Valerian (254-c.260).

The difference between Novatianists and Catholics related to the theory of the Church. Both parties agreed that the Church was 'holy,' as asserted in the creed, but the Novatianists interpreted this to mean a holy membership, to be maintained by strict discipline, while the Catholics believed the Church was holy because of its sacraments, especially penance, by which holiness, if lost through sin, might be restored. The issue was similar to that raised by Montanus and Hippolytus (qq.v.), and it appeared again in the fourth century in the Donatist controversy. (See DONATISTS.) The Novatianists pushed their theory to its limit by insisting that even Catholics entering their communion should first be re-baptized.

Novatian's most important surviving work is *On the Trinity*. The tract entitled *Jewish Meats* relates to ceremonial questions. Some of the treatises formerly attributed to Cyprian are probably the work of Novatian, e.g. *Concerning Shows*, the *Value of Modesty*, and the *Praise of Martyrdom*. The anonymous treatise *Against Novation* is held by Harnack to be from the Roman Bishop Sixtus II. (257-58). Consult: Migne, *Patrol. Lat.*, vol. iii.; *The Ante-Nicene Fathers*, ed. by Roberts and Donaldson, vol. v. (New York, 1896); Harnack, *Geschichte der altchristlichen Litteratur* (Leipzig, 1893); id., *History of Dogma*, vol. ii. (London, 1896); Benson, *Cyprian* (ib., 1897).

NOVATION (Lat. *novatio*, renewal, from *novare*, to renew). In law, the substitution of one legal obligation for another. Novation may be accomplished by the substitution of a new for an old party to a legal obligation, which is in effect the creation of a new obligation, or it may be accomplished by the substitution of a new obligation for an old one by the same parties. When the old obligation is extinguished by a new one without change of parties, the transaction is sometimes spoken of as a merger of the old obligation into the new. See MERGER.

At common law, as under the civil law, there are three important classes of novation, as follows: (1) Novation by substitution of debtors. By mutual agreement a substituted debtor may assume payment of a debtor's obligation upon agreement of the creditor or obligee to accept him as a debtor, and to discharge the original debtor or obligor.

(2) Novation by substitution of creditors. By mutual agreement of all the parties a creditor may agree to discharge his debtor upon the debtor's agreement to accept a third party as a new creditor and to pay the debt to him.

(3) A new debt or obligation may be substituted for the old by mutual agreement between the same debtor and creditor.

The first class is of the most frequent occurrence at common law, but as all novations are dependent upon the substitution of a new obliga-

tion for an old by mutual agreement between an obligor and obligee, or between an obligor and obligee and a third party, it is evident that there may be as many particular forms of novation as there may be combinations by agreement among the parties specified.

As the essential element of novation is the agreement or contract between the parties, it is necessary that the essential elements of a contract, including meeting of the minds, promise, and consideration, should all exist in order to establish the relationship. In general the promise of the obligee to release the first obligor is sufficient consideration for the promise of the new obligor, and vice versa, and as the promise of each party to the novation is given in exchange for the promise of each of the others, it is necessary that the several promises should be contemporaneous. In order that the promise to give up rights under the earlier obligation may be a sufficient consideration for the new obligation, it is essential that the earlier obligation should be valid. There can be no novation of a void obligation. See CONSIDERATION.

As the result of a novation is the extinction of the earlier obligation, it follows that all liens attaching to it are extinguished unless expressly preserved or continued by the new obligation.

Properly any new obligation which is created by the parties to an old obligation and operates merely to suspend the old obligation for a certain period, instead of extinguishing it, is not a novation, but a merger.

New collateral agreements entered into as security for a preëxisting obligation do not effect a novation, as the original obligation continues in full force and effect.

Upon analogous classes of contracts, see MERGER; ACCORD AND SATISFACTION; SECURITY. See also ASSIGNMENT.

In the case of novation by the substitution of debtors, the substance of the transaction is that the new debtor pays the obligation of the old debtor, and is thus within the express language of the Statute of Frauds. As, however, the purpose of the Statute of Frauds was to require contracts which were in effect contracts of suretyship, or contracts in the nature of suretyship, to be in writing, the courts have uniformly held that contracts of novation are not within the statute and need not be committed to writing. See FRAUDS, STATUTE OF. Consult the authorities referred to under CONTRACT.

NOVA ZEMBLA (Russian *Novaya Zemlya*). The name of a group of two large and numerous small islands in the Arctic Ocean, forming a crescent-shaped chain extending from 70° 30' to 77° north latitude, and separating Kara from Barents Sea (Map: Asia, E 1). It is separated by Kara Strait, 30 miles wide, from Valgatch Island at the northeastern extremity of European Russia, and forms a part of the Russian Government of Archangel. The length of the two large islands, including the narrow strait between them, is about 740 miles; their average width is 60 miles, and their combined area about 34,500 square miles. The coasts are indented by numerous deep and narrow fiords, and the islands are rocky and mountainous, rising to a height of 3600 feet. The climate is cold throughout the year, and vegetation is dwarfed. Animals, however, are numerous, and

include bears, wolves and foxes, reindeer, ermines, and other fur-bearing animals, and large numbers of aquatic birds, while whales and seals are found in the surrounding seas. The islands are practically uninhabited, but are visited in summer by fishermen and hunters.

NOVEL (OF. *novelle*, *nouvelle*, Fr. *nouvelle*, from Lat. *novella*, fem. of *novellus*, new, diminutive of *novus*, new), THE. To designate modern prose fictions there are current two terms: *romance* and *novel*. The term *romance* (from the Latin adverb *romanice*), originally employed in Italy, Spain, and France (in other words, in the Romanic lands) to distinguish the common speech, i.e. the *lingua romana*, from the Latin of the learned, came in time to denote a composition in the vernacular—and finally any verse-tale of intrigue and adventure. The word 'romance' was established in English usage by the time of Chaucer. At first the word 'novel' was probably the name given to some new story. In the twelfth and thirteenth centuries it was common among the Provençal poets for a verse-tale of intrigue realistic in treatment. It was popularized in Italy by Boccaccio as the title of a short narrative in prose. When these Italian tales came into English, the word came with them. It first occurs (so far as has been discovered) in Painter's *Palace of Pleasure* (1566). In the hands of several English writers the Italian *novella* was by degrees expanded, until by the eighteenth century it filled a duodecimo volume. Then came Richardson and Fielding with their larger delineations of contemporary life, which with some hesitancy they and their public called novels. Somewhat after this fashion the word novel became in English the generic term for prose fiction. Up to March, 1766, the *Monthly Review* placed works of fiction under the head of "Miscellaneous Publications." In that month it made the subdivision "Novels." From the Renaissance down to the eighteenth century the word 'romance' was not much used in English. Then it began to appear as the explanatory title of the wild Gothic stories of Ann Radcliffe and her school. Since that time it has denoted a novel which represents men and women in strange, improbable, or impossible situations. Owing to very different literary conditions on the Continent, romance (French and German, *roman*; Italian, *romanzo*) is there the generic term, and novel still means a short tale. As its name by chance signifies, the novel as an easily recognizable literary species is a new thing. It hardly has a date before Defoe. And yet, in its genesis, the novel is as old as either the epic or the drama. Common to all peoples is the beast-tale, in which animals are made to speak and conduct themselves as men and women. Popular stories of this kind were taken up by scholars of a later period, trimmed, moralized, and preserved in writing. Fairy tales and anecdotes of every-day life undergo a similar process until transformed into the verse or the prose story possessing an art of its own. In Egypt story-telling belongs to the oldest times. Indeed, Egypt was the source of many a tale that long afterwards charmed Europe. (See EGYPT, section *Literature and Science*.) The Sanskrit collection of tales known as the *Panchatantra* or *The Fables of Bidpai* (composed about 300 A.D.), and the fables attributed to Æsop,

likewise Eastern in origin, found their way into Western Europe, and, blending with native incidents, became the basis of many a mediæval fiction in verse and prose. Very interesting is the Oriental device for stringing together a long series of tales, as in the *Seven Wise Masters*, widely diffused in the Middle Ages, and the better known *Arabian Nights*. This manner was adopted by Boccaccio in the *Decameron* and by Chaucer in the *Canterbury Tales*.

In India the novel, in the technical sense of the word, began probably with the *Adventures of the Ten Princes* (*Daśakumāracarita*) by Dandin (q.v.) in the latter part of the sixth century A.D. This is a romance of roguery. The three remaining novels are in a totally different vein. They are the *Vāsavadattā* of Subandhu (q.v.), and two romances by Bana (q.v.), the *Kādambarī* and the *Adventures of Harsha* (*Harshacarita*), an historical novel. Bana's works were influenced and in great part modeled on Subandhu. These three novels all belong probably to the seventh century A.D. In plot they show little action, but they abound in detailed description. The impression of both style and content, although monotonous to Occidentals, is sweet and smooth. The Pahlavi or Middle Persian literature has an interesting romance on the early Sassanian hero Ardashir Papakan. See *SASSANIDÆ*.

In China the novel did not develop until the Mongol dynasty (c.1260-1368). The Chinese classify their novels under four heads: usurpation and plot; intrigue and love; superstition; and roguery. These romances abound in action, but characterization is less developed. As examples of Chinese fiction, which is of vast extent, there may be mentioned the *San kuo chih yen i* of Lo Kuan-chung, which is historical; the *Shui Hu Chuan* of Shih Nai-an (?), a picaresque novel; and the *Hsi yü Chi*, which is based on the travels of Hiouen-Thsang (q.v.) in India. The Ming dynasty, which followed the Mongol, produced many romances, most of which are by unknown authors.

Fiction developed in Japan earlier than in China. The first novel of importance is the *Genji Monogatari*, a long romance of love, containing much valuable information regarding society about A.D. 1000. Before this there had been a number of *Monogatari*, or narratives, many of them novelistic in character, such as the *Taketori*, *Ise*, *Utsubo*, and *Yamato*. In the seventeenth century Japanese fiction revived after a long period of decline, and though pornographic in the writings of Saikaku, was purified in the romantic novels of Kioden, Bakin, and Tanehiko. The masterpiece of Kioden is the *Inadzuma Hioshi*, a romance of roguery. Greatest of all was Bakin, who achieved his best in his *Yumi-baritsuki*, published in 1805, although his work is disfigured by extravagancies and impossibilities—a statement which holds good of another work of his, perhaps the most famous of all Japanese novels, the *Hakkenden*, which recounts the adventures of eight heroes of semi-canine birth, who typify the eight cardinal virtues.

The ancient Greeks had their popular tales, about which little is known. After the glory of their art had departed, there arose in the first centuries of the Christian Era a class of rhetoricians who composed long romances in prose. They belonged not to Greece proper, but

to Alexandria and the cities of Asia Minor. The basis of their romances is an erotic tale. According to the usual plot, boy and girl lovers are separated, and after countless perils on land and sea among pirates and thieves, they are finally united. There is no attempt at likeness to truth; all is governed by chance. Such are the loves of Theagenes and Chariclea, in the *Æthiopica* (fifth century ?), written by a certain Heliodorus. The *Æthiopica* is one of a group of romances to which belongs *The Marvellous Things Beyond Thule*, by Antonius Diogenes (second century), containing an account of a voyage to the North Pole, travels in the sun and moon, and of a descent into Hades; the *Babylonica*, by Jamblichus the Syrian (second century); the *Ephesiaca*, containing the germ of the story of Romeo and Juliet, by Xenophon of Ephesus (third century ?); *Apollonius of Tyre* (existing in a Latin version of the fifth century), the original of Shakespeare's *Pericles*; and *Clitophon and Leucippe*, by Achilles Tatius of Alexandria (fifth century), abounding in marvels and horrors duly explained, as in the romances of Ann Radcliffe. Standing by itself is the pastoral *Daphnis and Chloe* of unknown authorship, sweet, decadent, and sensuous. The extravagances of Eastern Greek romance, which must have been similar to those of Antonius Diogenes, were satirized by Lucian (born c.120 A.D.) in his *True History*. Lucian takes his hero into the belly of a whale, on to the morning star, and to the Elysian Fields. A more pronounced realistic aim is found in the *Golden Ass* of the African Apuleius (q.v.), written in Latin. Imbedded in its sensuality is the beautiful fairy tale of *Cupid and Psyche*. Ancient realistic fiction threw off all restraint in the *Satiricon* of Petronius Arbiter, which describes the debauchery of Roman society under the first emperors. To sum up, antiquity gave to the new nations of Western Europe a moralized prose tale, a romance constructed on the lines of the epic, an artificial pastoral, the burlesque, and the sketch of contemporary manners.

Through Arabic literature, as well as through other channels still obscure, Christian Europe became acquainted with Oriental fiction. The first finished Arabic stories were based on Persian models. Even during Mohammed's life-time, Nadr ibn Harith recounted at Mecca tales told by Persian merchants, and under the early Abbassides the r-~~u~~ al-Lahiqi rendered into Arabic verse the Iranian tradition of Ardeshir and Anosharvan. To the same period belong the lost translation of Bidpai by Rozbih (also called Ibn ab Mugaffa), an ancient version by al-Kisravi of the Sindbad story, which version has not been preserved, and ibn Babuya's rendering of the Buddhist legend of Barlaam and Josaphat (q.v.), which has come down to us. The native Arabic short story was not, however, altogether neglected, although the books of al-Jahiz (died 869), Abu Bekr ibn abi 'd-Dunya (died 894), and Muhsin al-Tanukhi (died 997) are of little importance for the history of the novel. The novelettes in Arabic were more remarkable for quantity than for quality, and the erotic poems and stories of al-Sarraji (died 1108) summed up this class of literature during the Ommiad and early Abbaside periods. Arabic fiction culminated in the thirteenth century in the collection of *The Thousand Nights and One Night*, usually called the

Arabian Nights (q.v.), and in the romance of *Antar* (q.v.).

THE MIDDLE AGES IN EUROPE. Among the new peoples after the fall of Rome, just as among the Greeks, the epic flourished long before romance. But by the end of the twelfth century the epic impulse which had created *Beowulf* and the *Chanson de Roland* had spent its force, and the age of romance had begun. Around characters and events, historical in truth or believed to be historical, the trouvères were weaving strange and marvelous incidents. Inexhaustible themes they found in Charlemagne, Arthur, Alexander, and the siege of Troy. Out of 'the Celtic matter' especially, they created permanent character types—Arthur, Lancelot, Percival, Guinevere, and Isult. These verse tales began to yield in the thirteenth century to the romances of adventure, which frequently laid no claim to historical truth. The choicest extant specimen of them is the 'chantable' *Aucassin et Nicolette*, in prose and assonanced verse, meant to be sung. By the side of romance were cultivated the *fabliaux* (q.v.), which depicted the intrigues and the humorous side of life. The leading types of mediæval fiction received their highest finish from the hand of Chaucer. The *Canterbury Tales* and *Troilus and Cryseyde* mark important steps from romance to the novel. There were already signs of the age of prose, soon to demand a printing press. The Arthurian romances were turned into prose in the thirteenth century. The *Gesta Romanorum*, a Latin collection of stories, first got into print in 1472, but these stories are doubtless of a much earlier origin. By 1353 Boccaccio had published the *Decameron*. About two centuries later the *Decameron* furnished the plan of the *Heptameron* of Margaret of Navarre. Through the Greeks in Southern Italy and the Crusaders, Greek fiction reached Western Europe in the twelfth century and earlier. The boy and girl separated by pirates or some chance, and brought together in a pretty recognition scene, became a common type in the romances of adventure. Eastern tales, coming likewise through Italy and also through the Moors in Spain, were mingled with native incident in the *Gesta Romanorum*, the French *fabliaux*, and the Italian *novelle*, and from these sources they spread still more widely.

MODERN TIMES, FROM CAXTON TO RICHARDSON IN ENGLAND. The invention of printing (fifteenth century) meant the end of the verse tale except as a survival. Of course, the transition from verse to prose was not sudden. A prose style suitable to orderly narrative had to be created, and the audience of the minstrel had to be taught to read. Both processes were slow. The first schoolmasters and the founders of English prose were Caxton and the learned printers who followed him. The first book printed in the English language was a collection of stories in which the divinities of ancient Greece are transformed into the lords and ladies of feudal society. It is known as the *Recuyell of the Histories of Troy*, and was printed by Caxton, probably in 1474, at the press of Mansion in Bruges. After Caxton had set up his own press in Westminster, he issued many romances, which were commonly prose expansions of mediæval tales and legends. Most significant of all is the *Morte d'Arthur* (1485), compiled from various sources by Sir Thomas Malory in 1469-70. The result was not

a well-constructed romance: the matter was too heterogeneous for that. But it was a fiction "pleasant to read" and "written for our doctrine." Of especial interest, too, are *Reynard the Fox* (1481), the *Four Sons of Aymon* (1489), and *Blanchardin and Eglantine* (1489). The great labors of Caxton in translating, editing, and printing were continued by his noble followers in the sixteenth century. Perhaps the finest work done by or for them was *Huon of Burdeus*, a half-fairy tale translated by Lord Berners out of the French. To this time belongs also the *Utopia* (c.1515), by Sir Thomas More. A full list of the romances issued by the English press before 1550 would be a revelation as to the spread of the taste for reading marvelous tales.

But the redactors employed by the printers in compiling bulky volumes lost sight of plot. The *Morte d'Arthur* is a series of biographies loosely connected with the career of King Arthur. Before there could be a novel, chaos had to be reduced to order. That service was performed after a fashion by Spain. *Amadis of Gaul* (q.v.), with its typical Greek story of the separation and the final union of the hero and heroine, thus becomes the first prose romance of chivalry. The pastoral, partly in verse and partly in prose, which had assumed a tenuous form in the Italian *Aracadia* (1504), by Jacopo Sannazaro, was developed by the Spaniard Montemayor in his *Diana* (1560). Still further, an unknown Spaniard transformed the tricks of medieval tales into the short novel of manners. A merry scamp is put behind the scenes and permitted to relate what he sees there. The earliest of these so-called picaresque, or rogue, stories is *Lazarillo de Tormes* (1554). It was followed by a host of others, from which we rightly date the beginnings of the modern realistic novel. But the glory of Spain is *Don Quixote* (q.v.). To outward appearances merely a burlesque of the romances of chivalry, it also contains a careful delineation of manners and two character-types—Don Quixote and Sancho Panza—who, as has been said again and again, are a summary of human nature.

To the Elizabethans, everything of importance that had been done in fiction abroad was well known. And yet in this age of the drama there was no very marked advance in the art of fiction. Sidney's *Arcadia* (1590) is an attempt to unite the pastoral and the romance of chivalry, and to give them the structure of the *Æthiopica* of Heliodorus. The pastoral as written by Greene, Lodge, and many others, was the old romance of adventure reduced to prose and put in a new setting. What its possibilities were, had it been cultivated by a great literary artist, we may imagine from Shakespeare's *As You Like It*, founded on Lodge's *Rosalynde*. The most popular Elizabethan fiction was Lyly's *Euphues* (1579), a romance of high life. For the enchantments of the romance of chivalry, Lyly substituted a wondrous natural history, which he derived from beast-books or made up as he went along. As a realist great powers were displayed by Thomas Nash in his ill-constructed *Unfortunate Traveller*, or *Jack Wilton* (1594). Indeed, Nash anticipates the manner of Defoe.

Puritanism was a check to the imagination. From Elizabeth to the Restoration, the only notable fiction is the *Argenis*, by John Barclay,

composed in Latin (1621) and soon translated into French and English. Mainly a political romance framed to the Greek story of adventure, it is significant as an attempt also at history. It seems to be an important link between antiquity and the French *roman de longue haleine* cultivated by Gomberville, La Calprenède, and Mlle. Scudéry. Of this type the best examples are Scudéry's *Grand Cyrus* and *Clélie*, each in ten octavo volumes. The extravagances of Scudéry were turned to finer issues by Madame de la Fayette in the *Princesse de Clèves* (1678), often regarded, because of its sane analysis of passion, as the first French novel. To this period belongs also a famous pastoral, the *Astrée*, by Honoré d'Urfé (1610-27), which was burlesqued by Charles Sorel in the *Berger extravagant* (1627). There were, moreover, many realistic novels, as Sorel's *Francion* (1622), Scarron's *Roman comique* (1651-57), and Furetière's *Roman bourgeois* (1686). Akin to the Spanish picaresque novel, they all give a humorous description of middle and low-class life.

After the Restoration, novel-writing was resumed in England. French romance was imitated; and a long series of low adventures was put together by Richard Head under the title *The English Rogue* (first part 1665). Of more interest is *Oroonoko* (1696; written much earlier), by Mrs. Aphra Behn (q.v.). In this short novel, founded on real events, there is some attempt at local color. But of all writers of this time John Bunyan (q.v.) did most for fiction. Bunyan spoke from the heart. And, however impossible might be the tale he undertook to tell, he knew how to add the minute details that make fiction seem truth. Bunyan's successor was Daniel Defoe (q.v.). In narrative power Defoe was Homeric. His style is all movement; even description is turned into narrative. Because of its style, its interesting incidents so treated as to give the illusion of reality, and its ethical import, *Robinson Crusoe* (1719) is rightly regarded as the first worthy treatment of adventure. It has been asserted that Defoe was forestalled by Grimmelshausen's *Simplicissimus* (about 1669). This German story of adventure, however, belongs to the old order. In France, Lesage had already published the first part of *Gil Blas* (1715), in which the picaresque novel was used as a vehicle of large satire on contemporary manners. Defoe took advantage of the immediate popularity of *Robinson Crusoe*. The succeeding novels possess all the qualities of the first except interesting subject matter. In *Gulliver's Travels* (1726), Swift at once gave the satirical romance its perfect finish.

THE REALISTS. After Defoe and Lesage, the novel was in danger of becoming plotless. It was Richardson who made the novel dramatic. *Pamela* (1740) is an expansion of the current bourgeois comedy such as Steele wrote. *Clarissa Harlowe* (1747-48) is an expansion of bourgeois tragedy such as Otway wrote. *Sir Charles Grandison* (1753) is likewise a comedy with its scene shifted to high life. Richardson's drama is not thus merely formal. He creates character-types, and he develops them in act and conversation before the mind's eye. Fielding, with his experience as a playwright, was able to improve upon Richardson's clumsy epistolary method. *Joseph Andrews* (1742) contains the matter of

the comic romances, such as Cervantes and Scarron wrote, but is molded to the form of ancient comedy. His masterpiece, *Tom Jones* (1749), is a clever union of many types of comedy for many effects. *Amelia* (1751) is the pathetic drama of family life, then common in France and England. Fielding makes no use of letters (except for burlesque) or of journals and memoirs. His characters speak directly, and the narrative, though hampered at times by episodes, is mostly in the third person. All the essentials of the novel were thus worked out by Richardson and Fielding. Since their time the advance in structure has been only in details. The novel left their hands a well-ordered literary species. They both aimed, each in his own way, to depict the inner and the outward life as it is. They were realists. True, a good deal that was traditional in fiction found its way into their work. The dastardly scenes in Richardson, which now so shock readers, were survivals from Greek romance. And Fielding appropriated the old picaresque escapades. Later realists, having mostly rid themselves of all this material, depend rather upon their own experience and observation. And though few novelists have dared discard love altogether as a motive, it is now treated less in its physical aspects. In spite of all this, which is indicative of the later development of fiction, probably no novel takes to itself more of human life than *Tom Jones*. No characters stand in clearer outline than its hero and Squire Western.

Richardson's work ended with *Sir Charles Grandison*, and Fielding died in 1754. Tobias Smollett survived them. Much under the influence of the picaresque writers, he was careless in manner, and his imagination delighted in coarse and brutal scenes. He, however, created many caricature types at once professional and national—the Irishman, the Welshman, and the Scotchman. *Roderick Random* (1748) is the first novel of the sea from the pen of a seaman. *Humphrey Clinker* (1771) is, said Thackeray, "the most laughable story ever written." In distinction from the humor of Fielding, Smollett is comic. His formlessness and audacity became affectations with Laurence Sterne. *Tristram Shandy* (1759-67), beginning nowhere and ending nowhere, is hardly a novel, but it contains passages of the highest beauty, and a brotherhood of fools unequalled outside of Shakespeare. At this time Oliver Goldsmith wrote the *Vicar of Wakefield* (1766), the source of many idyls of village life.

The novel thus began at once to break up into several varieties. This process, owing to social conditions, went on apace. In the next generation there was a numerous class of writers who resorted to the novel for the purpose of popularizing theories of education and government. They were inspired by Rousseau and other French philosophers. Among them were Robert Bage, Charlotte Smith, Elizabeth Inchbald, Thomas Holcroft, and William Godwin. It may be claimed for them that they founded the didactic novel. Fielding had depicted his characters through *what* they said in dialogue. Except in the case of Squire Western, little stress was placed upon *how* they spoke. Here was another lesson to be learned from the drama or rather from the actor. And as soon as it was learned, we had the novel of manners. Frances Burney was the pioneer with her *Evelina* (1778) and

Cecilia (1782). In the Irish tales of Maria Edgeworth, as *Castle Rackrent* (1800) and *The Absentee* (1812), the interest centres wholly on the speech and appearance of the characters. They are the first dialect stories. The novel of manners reached its highest art in the work of Jane Austen, well represented by *Pride and Prejudice* (1813) and *Mansfield Park* (1814), admirable in structure, movement, and tone. Here first the drama and the epic became perfectly fused. The sentimental novel has perhaps had its greatest exponent in Goethe, whose *Leiden des jungen Werther* (1773-74) set half of Europe to pondering over suicide and other morbid themes. *Wilhelm Meister* (1795, begun some twenty years earlier), on the other hand, is an autobiographic and to some extent a didactic novel.

ROMANCE AND SIR WALTER SCOTT. The old romances never became quite dead. As late as 1752, Charlotte Lennox thought it worth while to ridicule them in the *Female Quixote*. Under the impulse of the romantic spirit which was pervading all literature, a short ghostly romance was published by Horace Walpole in 1764. His *Castle of Otranto* set the standard for many writers, among whom were Clara Reeve, Ann Radcliffe, William Beckford, M. G. Lewis, C. B. Brown, William Godwin, and Mary Shelley. Perhaps the most typical specimen of their work is Mrs. Radcliffe's *Mysteries of Udolpho* (1794), which definitely marks an interest in scenery for its own sake. Godwin's *Caleb Williams* (1794) is the first detective story. These romances of the eighteenth century are forerunners of the tales of terror and wonder by Poe and Hawthorne. But Poe gave them a new art in the *Fall of the House of Usher* (1840) and the *Masque of the Red Death* (1842). To Hawthorne they suggested a dress for psychological problems. Walpole and his school commonly placed their scenes in mediæval times; hence, their romances were known as 'Gothic,' and they are, in a manner, historical in setting. It was a natural step for an innovator to make history the main interest. Such a step was taken by Sophia Lee, whose *Recess* (1783-86) is an historical fiction of the time of Queen Elizabeth. Her example was followed by many others, among whom were James White, W. H. Ireland, and, most noteworthy of all, Jane Porter, author of *The Scottish Chiefs* (1810). Nothing could be more preposterous than the way in which these writers dealt with history. Characters and incidents of different periods they introduced into the same scene. But they rarely employed the historical allegory; and they made possible *Waverley* (1814). To the amazement of his contemporaries, Scott poured forth during the next sixteen years about thirty novels, covering English and Scotch history, with some gaps, from William Rufus to 1800. Among his English followers were Horace Smith, G. P. R. James, Harrison Ainsworth, and James Grant. He inspired Manzoni in Italy, Freytag in Germany, and Hugo and Dumas in France. His *Pirate* suggested to James Fenimore Cooper the brilliant tales of the sea beginning with *The Pilot* (1824); and for his Leather-Stocking Series, containing *The Last of the Mohicans*, *The Pathfinder*, and *The Deerslayer*, Cooper became known as the American Scott.

THE RETURN TO THE NOVEL OF CONTEMPORARY LIFE. Scott's influence on the novel is not summed

up by giving a list of his imitators or of those writers who discovered new romantic themes. He is in Thomas Hardy's woodland scenes as much as in Stevenson's *Master of Ballantrae*. He depicted the showy virtues, vices, and scenes in his outer plot, but beneath there was always careful observation of common life. Throw off the outer covering, and you have the realistic novel. This was done by several writers, as Susan Ferrier, John Galt, and D. M. Moir, who wrote capital sketches of Scotch manners. Throw out the historical setting, and you have once more the novel of contemporary manners. The transition is well marked by the work of Bulwer-Lytton. Likewise Charles Kingsley romanced the sea and ancient history (*Westward Ho!* and *Hypatia*) and dealt with the social conditions of his own time (*Yeast* and *Alton Locke*). But the immediate vogue of romance and history had already been checked. In France, Balzac was insisting, in theory and in practice, that the novel should be a document based upon experience and observation. Balzac's vast *Comédie humaine*, aiming to represent every phase of French life, worked mightily in England, and gave fiction everywhere an encyclopædic character. In England the novel returned to the humors of society with *Pickwick* (1836-37). In this novel of great scope (for it contains more than 350 characters) appear the London cockneys. Having discovered London, Dickens went on to illustrate it in all its phases, and to include in his canvas much from the provinces, until he had created caricature types running into the thousands. Thackeray wrote *Vanity Fair* (1847-48). Instead of a Little Nell, he took as heroine Becky Sharp, and made her adventures the medium for depicting the ways of the middle class. This novel was followed by *Pendennis*, *The Newcomes*, *Esmond*, *The Virginians*, and *The Adventures of Philip*. All possess exquisite humor and irony. In their somewhat loose structure they lean to the epic. But the method of procedure is dramatic. No other novelist has ever come near Thackeray in making his characters develop from page to page; witness both Becky Sharp and Rawdon Crawley.

At this time George Borrow was writing his eccentric gypsy novels, *Lavengro* (1851) and *Romany Rye* (1857), and Charles Reade was winning popularity. The way in which Reade and Dickens put together the novel of social satire was very displeasing to Anthony Trollope, who accused them of creating vices in the upper and middle classes merely to attack them. His ideal of a novel Trollope presented in the *Chronicles of Barsetshire* (1853-67), comprising *The Warden*, *Barchester Towers*, *Doctor Thorne*, *Framley Parsonage*, *The Small House at Allington*, and *The Last Chronicle of Barset*. In this imaginary shire, he describes the clergy and their friends with a pleasing humor, running now and then into farce. Trollope brings his characters directly before the reader and lets them play out the drama. No one ever forgets characters like Septimus Harding, Mrs. Proudie, and Archdeacon Grantley.

THE PSYCHOLOGICAL NOVEL. Corresponding with the sequence of incident there is a sequence of thought and emotion. Lay the stress on incident and you have the romance or the novel of manners; lay it on the inner life and you have the psychological novel. Since Defoe, the novel had to an extent swung between these two methods.

But the psychological novel hardly became aware of itself before the middle of the nineteenth century. Hawthorne comes to the fore. Alike in his longer and shorter tales, as *The Scarlet Letter* and *The Great Stone Face* (1850), he probes the conscience. Emily Brontë's *Wuthering Heights* (1848) is an intense lyric. Likewise in Charlotte Brontë's *Jane Eyre* (1847) and *Villette* (1853) what holds one spellbound is the spiritual life externalized in incident. Here, too, the work of Elizabeth Gaskell, best known as the author of *Cranford*, has significance. In her *Ruth* (1853) she employed for unifying the plot an ethical formula which may be styled the doctrine of the act and its consequences. But the memorable date in the history of the psychological novel is 1859. In that year appeared George Eliot's *Adam Bede* and George Meredith's *Ordeal of Richard Feverel*. In her first long story George Eliot kept in harmony the inner and the outer life; and each added to the interest of the other. Certainly after *The Mill on the Floss* (1860), incident was no longer able to sustain the philosophy. And yet *Romola* (1863) and *Middlemarch* (1871-72) are her most relentless studies in moral decay. All her novels are constructed on some variant of the doctrine of the deed and its consequences. George Meredith selects a small group of characters in a clearly defined situation—as in *The Egoist* (1879) and *Diana* (1885)—and then studies minutely their behavior. His view is less comprehensive than George Eliot's, but his analysis is more subtle.

RECENT PHASES. In 1903, for the time being, psychology seemed to have run its course in English fiction. True, some of the characteristics of Henry James connect him with Meredith; but James is master of several manners. The best contemporary work in psychology is represented by Paul Bourget, at the head of a French group. From the older psychology sprang the philosophic novel. The psychologists had their ethical formula, but it was not all-important. The philosophers thrust to the front determinism, an ethical theory whereby conduct is made to depend wholly upon heredity and environment; man is no longer a free moral agent. On this theory was planned the entire series of Emile Zola (q.v.), called *Les Rougon-Macquart* (1871-93). Thomas Hardy now stands for the very best type of the newer realism. The philosophical novel belongs rather to the past, and its place has been taken largely by the novel of a more distinct purpose, often called the problem novel, for it aims at the solution of some social problem. Such, for example, is Hardy's *Jude the Obscure* (1895). This kind of novel is in part an inheritance from Dickens and in part a natural development from George Eliot. It discusses, by turn, creeds, heredity, class distinctions, agrarian conditions, labor and capital, municipal government, tenement house reform, the enfranchisement of woman, the failure of marriage, the grounds for divorce, etc. The last three topics on the list have been favorites with many woman novelists. To this kind of fiction dignity has been given by three writers, artists as well as thinkers, each belonging to a different country and each possessing his own methods: Tolstoy in Russia, Björnson in Scandinavia, and Mrs. Humphry Ward in England.

Other novelists, though equipped with ideas, have depicted contemporary manners with a less

obvious purpose. Somewhat in line with Trollope were the many stories by Margaret Oliphant, as the *Chronicles of Carlingford*, including *The Doctor and Salem Chapel* (1863). Henry James and W. D. Howells, beginning as romancers, worked their way out to a delicate realism; the first under the influence of Turgeneff and Daudet; the latter under the influence of Tolstoy and of Spanish fiction as represented by Valdes and Galdós. James may fairly be said to have created the international novel. His field has been successfully invaded now and then, as by DuMaurier in *Tribby* (1894). In his later work James has studied the English drawing-room. Howells has confined himself to illustrating American types, as in *A Modern Instance* (1883) and *The Rise of Silas Lapham* (1885). From national types, the novel both in England and in the United States has run into provincial types, and consequently into dialect. J. M. Barrie and John Watson spread knowledge of the Scotch parish. Jane Barlow has described with much sympathy the Irish village. The tragic aspects of life in Devon, Somerset, and London have been presented with much force respectively by Zack (Gwendoline Keats), Walter Raymond, and George Gissing; some phases of South Africa by Olive Schreiner, and both picturesquely and psychologically by Joseph Conrad; and of Australia by Tasma (Madame Couvreur) and Ada Cambridge. Likewise various sections of the United States have been treated by novelists. To New England belong Elizabeth Stuart Phelps, Mary Wilkins, Sarah Orne Jewett, and many others; to the Mississippi Valley, Mark Twain; to the Far West belong Bret Harte, Owen Wister, and Hamlin Garland; to the South, Mary Murfree, G. W. Cable, Hopkinson Smith, and T. N. Page. The society novel holds its own. Two notable successes in the last decade were E. F. Benson's *Dodo* (1893) and Anthony Hope Hawkins's *Dolly Dialogues* (1894).

Of wider amplitude is the work of Rudyard Kipling, who made known an India that had escaped the observation of other Europeans. Manners and customs he describes, and he has sketched a few types of character. But with him the energy goes mainly to telling a good story. That he has thus restored to fiction interesting incident is perhaps his great distinction.

These and other realists have greatly modified the outer form of the novel. Very generally the three-volume novel has been cut down to one volume. This has rendered necessary the excision of long descriptive passages and moral comments. The characters are now developed by what they do and say, as much as by what somebody else says about them. Indeed, it has been found possible to write a novel wholly in dialogue. The short story of a few pages has also found its readers. To this discovery France and the United States for a period contributed most, though the short story is far older than Boccaccio. In France the cultivation of the short story is encouraged by the literary character of the press. Of this genre, there is nothing superior to the work of Daudet and Maupassant. The short story had another master in Gottfried Keller (q.v.), and found an expert also in Paul Heyse (q.v.). In the United States the short story, which has existed by right since Poe and Hawthorne, is best adapted to the magazine. It has assumed various forms under the hand of many

writers. England has held rather to the serial. But in Kipling she has found an innovator, who has brought into vogue a tale of from twenty-five to fifty pages. In the nineteenth century many short stories, and sometimes even the long novel, were devoted to the portrayal of animals other than man. By Joel Chandler Harris, in his stories of *Uncle Remus* (1880), animal life is treated fantastically, but with a never absent consciousness that the adventures of Brer Rabbit, Sis Cow, Mr. Wolf, and their fellows are fantastic. Thus we get the humorous animal story based on folklore, as in the *Roman de Renard*. Kipling's *Jungle Books* (1894-95) gather Indian folklore about animals into short stories of great power. Herein the animals are again not wholly natural, but they act more naturally than in the stories of Uncle Remus. The tales of the Canadian C. G. D. Roberts range from the slightly fanciful to the wholly real. In *Bob, Son of Battle*, the Englishman Ollivant wrote an entertaining novel about the rivalry between two sheep-dogs, Bob and Wullie. W. Fraser, who wrote *Mooswa of the Boundaries*, is esteemed highly by naturalists and lay readers, for his imaginative yet truthful stories of wild life. Ernest Thompson Seton's earlier work portrays the life and death of wild animals with some accuracy. His stories distinctly belong to fiction and not to artistic zoology.

Since Scott, romance and adventure have never been absent from English fiction. Wilkie Collins became everywhere known by his *Woman in White* (1860), which was followed by many similar mystifications, as the *Moonstone* (1868). For the detective story he is the connecting link between Poe and Conan Doyle. In 1869 appeared *Lorna Doone*, the first of R. D. Blackmore's picturesque fictions, historical in setting and written in rhythmic prose. Then came the numerous romances of William Black, of which the type is *A Princess of Thule* (1873); the beautiful fancies of Richard Jefferies, as *Wood Magic* (1881) and *After London* (1885); and the tales of William Morris in verse and in prose. But the romancer of most pronounced influence on the English novel was Robert Louis Stevenson. In *Treasure Island* (1883) he gave style and a new form to the tale of adventure. In *Dr. Jekyll and Mr. Hyde* (1886) he fashioned the old story of wonder to an ethical purpose. In *Kidnapped* (1886) and *The Master of Ballantrae* (1889) he revived after his own way the historical romance. In *Prince Otto* he wove a dream into the semblance of history. And in *Ebb Tide* (1894) adventure was carried to the South Seas. From Stevenson there are several lines of development. Among those who have followed him in history are Conan Doyle, S. R. Crockett, Stanley Weyman, S. Weir Mitchell, and Winston Churchill. In Great Britain and her colonies, as well as in the United States, historical fiction enjoyed great popularity and often considerable intelligent esteem throughout the nineteenth century. In France historical fiction has been waning almost since the time when the elder Dumas announced that he had raised history to the dignity of fiction. Stevenson's fanciful history was transformed into delightful extravagance by Anthony Hope Hawkins in *The Prisoner of Zenda* (1894) and its sequel, *Rupert of Hentzau* (1898). Further removed from Stevenson are the more extravagant fictions of H. G. Wells with his time-

machines. Adventure wilder than Stevenson's is now represented by Joseph Conrad and the Australasian novelists Louis Becke and Guy Boothby.

See also the articles in this encyclopædia on literatures of various countries and on individual novelists. Several Australian novelists are described under AUSTRALIAN LITERATURE.

NOVELDA, nò-vál'dà. A town of South-eastern Spain, in the Province of Alicante, 15 miles west of Alicante, on the railway between that city and Madrid (Map: Spain, E 3). The town has oil mills and brandy distilleries, and there are sulphur springs in the neighborhood. Population, in 1900, 11,442.

NOVELLÆ (Lat., novels, nom. pl. fem. of *novellus*, new, diminutive of *novus*, new). In Roman law, the ordinances issued by Justinian after the *Institutes*, *Pandects*, and *Codez*. They were written for the most part in Greek, although the Latin version alone has survived. No official compilation of them was made, but they were

preserved in several private collections of varying comprehensiveness. One of these, the *Authenticum*, or *Liber Authenticorum*, was later regarded as the authoritative text, and in the twelfth century was incorporated, together with the other Justinian codes, in the *Corpus Juris Civilis*. See CIVIL LAW; JUSTINIAN I.; PANDECTS.

NOVELETTE, nòv'el-ét' (diminutive of *novel*). In music, a term invented by R. Schumann to characterize certain compositions (op. 21) in free form. A novelette is of some length and characterized by a great number of short themes introduced without regular succession. Schumann chose the name because in those works he made use of entirely novel effects both rhythmically and harmonically. Since then the form has been imitated by many composers.

NOVELLINO, nòv'el-lé'nò (It., the little novel), IL, or the CENTO NOVELLE ANTICHE. The oldest collection of tales in Italian, belonging to the thirteenth century. The subject matter comprises traditions of all kinds, biblical, classical, and chivalrous, stories based on historical fact or wholly fictitious. The tales seem to have been gathered from various sources; from oral tradition, from the books of chivalry, from the French *fabliaux*, and from other earlier collections in Latin. As might be expected at this early period, the prose is rather simple; it has, however, a remarkable spontaneity. Consult the first edition of the *Novellino* by Gualteruzzi (Bologna, 1525); that by Carbone (Florence, 1868); and that by Donin (Turin, 3d ed. 1890); A. d'Ancona, *Le fonti del Novellino*, in the *Studi di critica e storia letteraria*; Biagi, *Le Novelle Antiche* (Florence, 1880).

NOVELLO, VINCENT (1781-1861). An English musician and editor, born in London, of an Italian father and English mother. At the age of sixteen he was organist in the chapel of the Portuguese Embassy. He was one of the founders of the Philharmonic Society, and of the great music-publishing house in London, Novello & Co., established in 1811. His musical compositions, which are very numerous, and chiefly sacred, are considered to have contributed much to the improvement of cathedral music. As a painstaking editor of unpublished works of eminent musicians, he has accomplished much for musical literature. He died in Nice, France.

NOVEMBER. See MONTH.

NOVERRE, nò'vâr', JEAN GEORGES (1727-1810). A French dancer and reformer of the ballet, born at Saint-Germain-en-Laye. He was a pupil of the ballet master Dupré, and began as a dancer in the Royal Theatre. His ballets gave him such a reputation that Frederick II. invited him to Berlin. He then went to London on the invitation of Garrick, as master of the ballet in the Drury Lane Theatre (1755-57). Afterwards, he was equally successful at Stuttgart, Vienna, and other European cities. He was made ballet master at the Academy of Music in Paris in 1775, and there had the fullest opportunity to introduce those reforms which make him the real inventor of the modern ballet. His theory of the dance was that dress, music, and action must interpret one another. These ballets were often elaborated pantomimes of classical subjects treated in a serious manner. He also prepared the ballets in operas, notably that in

Gluck's *Iphigenia in Aulis*. His *Lettres sur les arts imitateurs en général et sur la danse en particulier* (1807) remain the authority on his art.

NOVGOROD, nŏv'gŏ-rŏd. A government of Russia, bounded by the governments of Olonetz, Vologda, Yaroslav, Tver, Pskov, and Saint Petersburg (Map: Russia, D 3). Area, about 47,300 square miles. The southern part belongs to the Valdai plateau and is mostly hilly. In the northeast are found a large number of lakes and immense impassable marshes—the beds of former lakes—covered with thin forests. The north-western part slopes toward Lake Ladoga and is thickly wooded. The district is watered by numerous rivers, which connect it with the Baltic, the Caspian, and the White Sea. The chief of them are the Volkhov (connecting the lakes Ilmen and Ladoga), the Sheksna and the Mologa, tributaries of the Volga, the Syas, flowing into Lake Ladoga, and the Msta, belonging to Lake Ilmen. Among the larger lakes may be mentioned the Byeloe and the Vozhe in the northeast. Many of the rivers are navigable and connected with each other and the lakes by an extensive system of canals.

The climate is severe, the yearly temperature at Novgorod averaging only 39° F. Farming is the leading industry, although its returns are so small as to oblige a large proportion of the population to engage in some other occupation, such as lumbering, or to emigrate for a part of the year to Saint Petersburg, where artisans from Novgorod are very numerous. The house industry is only slightly developed, the chief item of production being nails of an inferior kind. Wood, live animals, and hay are the chief exports, and there is a considerable traffic on the rivers and canals. Population, in 1897, 1,392,933, chiefly Russians belonging to the Greek Church. There are also a number of Non-Conformists. For history, see the article on NOVGOROD, the capital.

NOVGOROD, or NOVGOROD-VELIKI, vĕ-lĕ'kĕ (Great Novgorod). One of the oldest and most celebrated cities of Russia, capital of the government of the same name, situated on both banks of the Volkhov, about two miles from Lake Ilmen and 120 miles south of Saint Petersburg (Map: Russia, D 3). It is divided by the Volkhov into two parts, of which that on the left bank, with the Kremlin, is known as Saint Sophia, while that on the opposite bank is called the commercial side. There is very little in the insignificant and somnolent town to remind one of the ancient Great Novgorod, with its vast wealth, great foreign trade, and highly developed republican institutions. The Kremlin is surrounded by a stone wall dating from the fourteenth century and occupies a considerable area. Within the walls are situated the eleventh-century Cathedral of Saint Sophia, with a treasury of valuable relics, the twelfth-century Church of Saint Nicholas, and the Yaroslav Tower.

The churches of Novgorod are of the usual Russian style of architecture (see Moscow), having numerous round cupolas and dark and profusely embellished interiors. In 1862 a fine, massive monument was erected at Novgorod to commemorate the one thousandth anniversary of the foundation of the Russian monarchy. There are two gymnasia, a theological seminary, a *Realschule*, and two museums of antiquities. Econom-

ically, Novgorod is insignificant. There is some manufacturing of paper, flour, glass, trimmed lumber, etc., and agricultural products are exported to Saint Petersburg. A railway line, 45 miles long, connects with Tchudovo on the Moscow-Saint Petersburg line. Population, in 1897, 28,095.

HISTORY. The origin of Novgorod is usually connected with the story of the first appearance of the Varangians in Russia, and the town is supposed to have been the residence of Rurik (862) (q.v.) and his successor Oleg. With the rise of Kiev (q.v.), Novgorod became to some extent its dependency, and these relations continued until the end of the tenth century. In the eleventh century Novgorod was completely independent, electing its own princes. In the zenith of its prosperity the dominions of Novgorod the Great comprised the northern part of the present Russia above latitude 57° N., excluding Finland and the Baltic region. In its political institutions Novgorod then presented a striking contrast to the other principalities of Russia. Without an hereditary line of princes, and geographically isolated from the rest of the country, it was guided in the selection of its rulers chiefly by its economic interests. The supreme authority was the *vyetche*, or popular assembly, which was participated in by all freemen. This assembly elected the prince and the *posadnik* (mayor), as well as the commander of the army. At the height of its prosperity the city contained probably not fewer than 100,000 inhabitants, some authorities placing the number as high as 400,000. The Church of Novgorod was essentially a native church. The archbishop was elected by the *vyetche*, and there was the closest intimacy between the State and the Church. Commerce was the chief occupation and was carried on by corporations so as to embrace a very large part of the population. The advantageous location of the city rendered it well adapted for the trade with the Scandinavian and Hanseatic cities. Novgorod joined the Hanseatic League about the middle of the fourteenth century. It contained many foreign merchants, or 'guests,' to whom were accorded special privileges. Hungarian and English coins circulated freely.

In the middle of the thirteenth century Novgorod was under the rule of the national hero Alexander Nevski (q.v.). It held out the longest of Russian States against the tide of Mongol conquest, but was finally compelled to submit at the end of the thirteenth century. After the weakening of the Mongol power, Novgorod, although politically independent, was often compelled, for economic reasons, to take its princes from the House of Suzdal (Vladimir). With the rise of the principalities of Moscow and Lithuania, Novgorod became too weak to struggle against their encroachments, and was soon reduced to the necessity of paying tribute in order to retain its independence and republican institutions. In 1478 it succumbed to the arms of the Muscovite ruler, Ivan III., and was deprived of its liberties. Many of the prominent families were transferred to Moscow and replaced by families from the capital. The inhabitants having excited the wrath of Czar Ivan the Terrible, that monarch in 1570 wreaked a fiendish vengeance upon the city, putting thousands to the sword. This completed the downfall of Novgorod.

NOVGOROD-SEVERSK, syá'vèrsk. An historic town of Russia, situated in the Government of Tchernigov, on the Desna, 148 miles northeast of Tchernigov (Map: Russia, D 4). It has an old monastery and a gymnasium. At the end of the eleventh century it became the capital of an independent principality and subsequently was annexed to Lithuania. Population, in 1897, 9185.

NOVI, nò'vé, or **NOVI LIGURE**. A town in the Province of Alessandria, Italy, 33 miles north-northwest of Genoa, by rail (Map: Italy, C 3). It has several churches, a lyceum, museum, and public library. The town carries on manufactures of silk and woolen goods, and is the centre of a considerable trade. Novi was the scene, August 15, 1799, of a battle in which the Austrians and Russians defeated the French, the French General Joubert being slain. Population (commune), in 1881, 13,783; in 1901, 17,588.

NOVIBAZAR, nò'vé-bá-zár', or **NOVIPAZAR**. (Turk. *Yenibazar*). The capital of a sanjak of the same name, in the Vilayet of Kossovo, Turkey, on the Rashka, an affluent of the Ibar, 120 miles southeast of Bosna-Seari (Map: Balkan Peninsula, C 3). The town, situated in a fertile district, has important fairs and an active agricultural trade. There are remains of an ancient citadel and in the vicinity rises the Church of Saints Peter and Paul, the scene in 1143 of Stephen Nemanya's conversion from the Roman to the Greek Church. Novibazar is an important strategic point between Serbia and Montenegro, and, under the Treaty of Berlin, is garrisoned by Austria. The district about the town is the Rassia of the Byzantine historians. Population, about 12,000, chiefly Slavs.

NOVIE DUBOSSARY, nò'vyá dōō'bōs-sá'rè. A town of Russia. See DUBOSSARY.

NOVIKOFF, nò'vé-kóf, **NIKOLAI IVANOVITCH** (1744-1818). A Russian journalist and philanthropist, born at Avdotyino, Government of Moscow. He entered the civil service at eighteen, and was conspicuous in Catharine II.'s Reform Commission (1767), but retired in 1768 to devote himself to literature. In his satirical magazines, *The Drone* (1769-70) and *The Painter* (1772-73), he ridiculed Gallomania and combated serfdom and other evils of social and private life. A controversy with Catharine's satirical journals brought him into disfavor, and his periodicals were stopped. He retired to Moscow, where he leased the *Moscow Gazette* with its printing plant for ten years (1779-89) and endeavored to spread a love for literature by printing cheap books. His devotion to Freemasonry and his very extensive philanthropic work brought him into trouble, but not until the French Revolution did Catharine take any severe measures. In 1792 he was arrested on his estate and imprisoned in Schlüsselburg. All his property was confiscated, and the hospitals, schools, libraries, book-stores, etc., opened by him, were closed. Released by Paul I., he was confined to Avdotyino until his death. He published, in 1772, *An Attempt at a Lexicon of Russian Authors*, and in 1773-75 a collection of historical materials called *The Old Russian Library* (2d ed., 1788-89, republished by Myshkin, 1894). Consult a monograph by Nezelenoff (Saint Petersburg, 1875), and Luginoff, *Novikoff and the Moscow Martinists* (Moscow, 1867).

NOVIKOFF, OLGA (1840—). A Russian journalist and political agent, who lived long in England. She was born in Moscow of noble parents named Kireyeff, and married General Novikoff at the age of nineteen. Under her maiden initials, 'O. K.', she wrote much in the newspapers of the two nations, hoping to promote an alliance between them, and she made warm friends among British statesmen and historians, notably Gladstone, Froude, Kinglake, and Carlyle. Gladstone reviewed her *Russia and England* (1880) in the *Nineteenth Century*. She published, also: *Is Russia Wrong?* (1877); *Friends or Foes* (1878); and *Skobelev and the Slavonic Cause* (1884). After her husband's death, Madame Novikoff spent more of her time on her son's estates near Tambov, Russia.

NOVI LIGURE, nò'vé lē'gōō-rá. A town in Italy. See NOVI.

NOVOCHERKASK, nò'vò-chër-kàsk'. A city of Russia. See NOVO-TCHERKASK.

NOVOGEORGIEVSK, nò'vò-gá-ōr'gè-yéfsk. A town in the Government of Kherson, Russia, on a tributary of the Dnieper, 250 miles north of the city of Kherson (Map: Russia, D 5). Milling, tallow-boiling, and brewing constitute the chief industries. In the vicinity of the town are granite and limestone quarries. Population, in 1897, 11,200.

NOVOGEORGIEVSK, nò'vò-gyōr'gyéfsk. A strong fortress of Russian Poland, situated in the Government of Warsaw, at the confluence of the Bug with the Vistula, nine miles northwest of Warsaw. The principal fortifications, on the right bank of the Vistula, consist of a citadel and barracks surrounded by strong walls. The left bank of the Vistula and the banks of the Bug are also fortified. The place was originally fortified by Charles XII. of Sweden, and the fortifications were extended by Napoleon. The Russians captured it in 1813, and it was occupied by the Poles during the insurrection of 1830. The site of the fortress was formerly occupied by the town of Modlin, and the fortress is still known to the Poles under that name.

NOVOGRAD-VOLHYNSKI, nò'vò-grád-vò-lin'ské. A town in the Government of Volhynia, Russia, situated on the Slutch, 55 miles northwest of Zhitomir (Map: Russia, C 4). It manufactures leather, soap, and brick. Population, in 1897, 16,900, about one-half Jewish.

NOVOMOSKOVSK, nò'vò-mòs-kòfsk'. A town in the Government of Ekaterinoslav, Russia, situated on the Samara, 19 miles northeast of Ekaterinoslav (Map: Russia, E 5). It is known for its horse fairs, and manufactures leather. Population, in 1897, 12,862.

NOVOROSSIYSK, nò'vò-ròs-sèsk'. A sea-port town in the District of Tchernomorsk, Caucasus, on the Black Sea (Map: Russia, E 6). It lies on an extensive bay protected by a large mole. There is a considerable traffic in grain and naphtha. Population, 16,208.

NOVOSYBKOV, nò'vò-síp'kòf. A town in the Government of Tchernigov, Russia, situated 101 miles north of Tchernigov (Map: Russia, D 4). It lies in a marshy region and is unhealthy. It has numerous tanneries, slaughter houses, and tallow-melting establishments. Population, in 1897, 15,480.

NOVO-TCHERKASK, chër-käsk', or **NOVO-TCHERKASK**. The capital of the territory of the Don Cossacks, South Russia, situated near the right bank of the Don, 20 miles by rail north-east of Rostov-on-the-Don (Map: Russia, F 5). The educational institutions include two gymnasias, a *Realschule*, a cadet corps, a theological seminary, a seminary for teachers, and a technical school. There are two theatres, a museum containing the archives, and many antiquities found in the vicinity, and a public library. Distilling is the principal industry, and here are held two annual fairs of considerable importance. About 19 miles north of the town are the Grushev mines, producing one of the best kinds of anthracite in the world. Novo-Tcherkask is the seat of the ataman of the Don Cossacks as well as of the central administration of the territory. Population, in 1897, 52,000.

NOVO-UZENSK, -zënsk'. A town in the Government of Samara, Russia, situated on the river Uzen, 242 miles south-southwest of Samara (Map: Russia, G 4). Its annual fairs are of considerable importance in the trade with the Kirghiz Steppe. Population, in 1897, 13,475.

NOVOYE VREMIA, n'oi-ä vrä'myá (Russ., new time). The largest political daily in Russia, founded in 1868 and published at Saint Petersburg. After several years of precarious existence it was acquired by the prominent publicist A. S. Suvorin in 1876, and for a time counted among its contributors Nekrasoff, Shtchedrin, and Sophia Kovalevskaya. It took a leading part in the Panslavic movement of the seventies, and gradually lost its liberalism, so that at present it is moderate-conservative in tendency.

NOVUM ORGANUM (Lat., new instrument). The name of Francis Bacon's great work which led the way to the development of modern inductive logic. See **BACON, FRANCIS**.

NOWANAGAR, no-wä'nü-gür', **NAWANA-GAR**, or **NOWANUGGUR**. A seaport and capital of a native State of the same name, in the peninsula of Kathiawar, Gujarat, India, at the mouth of the Nagna, a small river on the south shore of the Gulf of Cutch, 160 miles southwest of Ahmedabad (Map: India, B 4). It is the terminal of a branch railway line from Rajkot, 54 miles to the east. The town is encircled by a fortified wall, four miles in length, and the buildings generally are of stone. It has pearl fisheries, manufactures of cloth and silk, and enjoys a considerable coastwise and inland trade. Population, in 1891, 48,530; in 1901, 53,844.

NOWELL, n'öl, INCREASE (1590-1655). An American colonist, born in England. He was one of the patentees of the Massachusetts Bay Company, was chosen an assistant, and accompanied John Winthrop to America in 1630. He became one of the leading spirits of the little colony, was the most important man among the thirteen who founded Charlestown, and was chosen ruling elder of their church. He was at various times secretary of the colony, treasurer of Harvard College, town clerk, and chaplain to the forces employed against the Narraganset Indians. Consult Budington, *History of the First Church, Charlestown* (Boston, 1845).

NOX (Lat., night). The personification of night, conceived as a still, dark figure, covering the world with her huge wings, and in her

kindness bringing rest to men. In Hesiod's *Theogony* she and Erebus are the offspring of Chaos, and from their union spring Æther (air) and Hemera (day). Of herself she produces Sleep and Death, and a multitudinous progeny, some friendly like the Hesperidæ, others grievous to men, as the Mære, or Fates, Ker, the goddess of violent death, Nemesis, the dreams, Momos, the faultfinder and mocker, while in Æschylus the Furies hail her as mother. The vagueness of the personification and the transparency of the name prevented Nox from becoming prominent in the cult, and for the same reason the type in art is not distinct, though the figure is found on some vases and sarcophagi.

NOYA, nō'yá. A town of Northwestern Spain, in the Province of Coruña. It is situated at the head of a fiord-like inlet surrounded by wooded mountains, 45 miles southwest of Coruña (Map: Spain, A 1). It is a second-class port of entry, and has some local trade. The town has two secondary schools and a bull-ring, and manufactures paper, leather, soap, cosmetics, and pottery. Population, in 1900, 10,321.

NOYADES, nwä'yäd' (Fr., drownings). A name applied to the atrocities practiced at Nantes during the French Revolution (1793-94), by Carrier, the Deputy of the Convention, who put to death over 800 persons by penning them in scows and scuttling the vessels in the Loire. This mode of execution was also known as 'vertical deportation.' See **CARRIER**.

NOYAU, nwä'yö' (Fr., kernel), or **CRÈME DE NOYAU**. A liqueur commonly made from white brandy, flavored with bitter almonds, or the stones of the cherry, peach, or apricot. In Dominica it is flavored with the bark of the noyau tree (*Cerasus occidentalis*), and in France sometimes with the leaves of a small convolvulus-like tropical plant, called *Ipomœa dissecta*. It is colored white and pink.

NOYES, noiz, ARTHUR AMOS (1866-). An American chemist, born at Newburyport, Mass. He received his education at the Massachusetts Institute of Technology, and went to the University of Leipzig in 1888. In Germany he devoted himself, under the direction of Wilhelm Ostwald, to research in physical chemistry. In 1890 he was made instructor in chemistry at the Massachusetts Institute of Technology; in 1893 he was appointed assistant professor there, and in 1899 received the full professorship of organic and theoretical chemistry. He became known as a lecturer of uncommon ability, full of sincere enthusiasm for his subject. Dr. Noyes contributed the results of his researches mostly to the *Zeitschrift für physikalische Chemie*, his papers dealing mainly with the application of the law of mass action to the solubility of mixtures of salts. Practically all our knowledge on this important subject of physical chemistry is due to the researches of Dr. Noyes. Several of his papers deal with synthetic problems in the chemistry of the compounds of carbon. His book-form publications include the following: *A Detailed Course of Qualitative Chemical Analysis of Inorganic Substances* (1895); *Laboratory Experiments on the Class Reactions and Identification of Organic Substances* (jointly with Dr. Mulliken, 1899); *General Principles of Physical Science* (1902).

NOYES, HENRY DRURY (1832-1900). An American ophthalmologist. He was born in New York City; graduated from New York University in 1851, and from the College of Physicians and Surgeons in 1859; and in 1866 became professor of otology and ophthalmology in the Bellevue Hospital Medical College. Dr. Noyes was one of the founders of the American Ophthalmological Society. He introduced into the United States the use of cocaine as a local anæsthetic. Among his works are *A Treatise on Diseases of the Eye* (1881) and *A Text-Book on Diseases of the Eye* (1890, and after).

NOYES, JOHN HUMPHREY (1811-86). The founder of Oneida Community (q.v.). He was born September 6, 1811, at Brattleboro, Vt.; studied theology at Andover and Yale, and became a Congregational minister. In 1834 he founded the sect known as Perfectionists or Bible Communists at his parents' home, Putney, Vt. He married one of his converts, and thus secured the means to establish a community in which all things were held in common. Religious rites were given up and 'complex marriage' supplanted monogamy. Noyes sought to introduce what he believed to be the communism of the early Church. Internal dissensions and external opposition dissolved the community, but about 150 of the members soon assembled again at Oneida, N. Y. Noyes remained the leader of the society until the latter part of the seventies, when he was obliged to flee to Canada to escape prosecution because of his marriage system. He died in Canada, April 13, 1886. He wrote: *The Berean* (1847); *Bible Communism* (1848); *History of American Socialism* (1870).

NOYES, WILLIAM ALBERT (1857—). An American chemist, born near Independence, Iowa. He received his education at Iowa College, and then studied chemistry at the Johns Hopkins University in Baltimore. From 1883 to 1886 he was professor of chemistry at the University of Tennessee, and in 1886 was appointed to a similar post at the Rose Polytechnic Institute, at Terre Haute, Ind. He wrote *Organic Chemistry for the Laboratory* (1897) and *Qualitative Analysis* (1898), and carried out a number of researches in organic chemistry, the most important of which have served to throw much light on the constitution of camphor and allied compounds.

NOYES, WILLIAM CURTIS (1805-64). An American lawyer, born at Schodack, Rensselaer County, N. Y. He began to practice law in 1827, in Oneida County, where he quickly took high rank. He removed to New York in 1838, immediately took a place among the eminent lawyers, and in 1857 was appointed, with A. W. Bradford and David Dudley Field, to codify the laws of the State. In politics he was at first an anti-slavery Whig, and afterwards joined the Republican Party. In 1861 he was a member of the Peace Conference. He bequeathed a valuable law library to Hamilton College.

NOYON, nwā'yōn'. A town in the Department of Oise, France, on the Verse, 67 miles by rail northeast of Paris (Map: France, J 2). Its cathedral, founded by Pepin the Short and rebuilt in 1150, is interesting for its transitional phases from Romanesque to Gothic. The principal industries are sugar refining and the manufacture of cloth, laces, leather, and chemicals. Population, in 1901, 7443. Noyon, ancient Noviodunum

Veromanduorum, was prominent in Merovingian and Carolingian times. John Calvin was born at Noyon.

NOZZE ALDOBRANDINI, nō'tsā al'dō-brān-dē'nē (It., Aldobrandini Marriage). One of the finest ancient pictures extant, preserved in the Vatican Library. It is a mural painting, copied from a fine Greek original, and was found in 1606 near the Arch of Gallienus. It was first owned by Cardinal Aldobrandini, after whom it is named. The painting represents the preparations for a wedding, and is soft and harmonious in coloring, though of only average technical execution.

NOZZE DI FIGARO, dē fē'gā-rō, LE (It., Marriage of Figaro). An opera, the music by Mozart (1786), and words adapted by Da Ponte from Beaumarchais's *Mariage de Figaro*.

NŪ, nōō, or NUU, nōō (later form NŪN). An Egyptian deity personifying the primeval waters whence the sun-god Rē emerged to govern the world. Nū was regarded as the father of all the gods and the ultimate source of all created things. In a later phase of Egyptian theology, he was considered to represent, along with his spouse Nūt, the waters of the Nile. This Nūt, whose name is merely the feminine of Nū, must not be confounded with Nūt (q.v.), the goddess of the sky. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Lepsius, *Ueber die Götter der vier Elemente* (Berlin, 1856); Brugsch, *Religion und Mythologie der alten Aegypter* (Leipzig, 1888-90).

NUANCES, nu'āns' (Fr., shades). In music, the various shadings and means of expression in the interpretation of a composition. The term includes everything that enters into the finished rendering of a composition, such as acceleration or retarding of tempo, the degree of loudness of different tones, the execution of embellishments, rhythmic accentuation, phrasing, etc. It is these nuances that constitute the individuality of the style of various interpreters.

NUBA, nōō'bā. A term brought into prominence in ethnology by Friedrich Müller in association with Fulah in his Nuba-Fulah linguistic family. The Nubas are true negroes, having their home in Kordofan, Eastern Sudan, whence they spread into Darfur and Wadai. They are classified as: (1) Nubas proper (*Nuba, Kargo, Kulfan, Kolaji, Tumali*), living in Central and Southern Kordofan, Dar-Nuba (Arab. *dar*, land, and *Nuba*), and (2) Nilotic Nubas, forming an important ingredient in the people of Nubia (q.v.). See Stanford, *Africa*, vol. i. (London, 1895); Müller, *Allgemeine Ethnographie* (Wien, 1879).

NUBAR PASHA, nōō'bār pā-shā' (1825-99). An Egyptian statesman, born in Smyrna and brought up as a Christian. He was educated in Europe, and, beginning with his early entry into the public service, constantly sought to introduce European culture and administrative methods into his native land. After having been sent on frequent diplomatic missions, he was appointed in 1854 Ambassador at Vienna. The first Egyptian railway was built under his direction, and he concluded with the Powers negotiations for the construction of the Suez Canal (1864). He was Minister of Foreign Affairs in 1867-74 and again in 1875 and 1876, and Premier in

1878-79, 1884-88, and 1894-95. As Minister of Foreign Affairs he organized mixed courts for the adjudication of causes between Europeans and Egyptians.

NU'BIA. An extensive region in Northeastern Africa, lying between Egypt proper and Kordofan. Its boundaries are now without political significance; the portion lying north of the 22d parallel of latitude has recently been incorporated with Egypt, while the remainder belongs to Egyptian Sudan (q.v.). Its limits have always been indefinite, and it may be roughly described as lying between the parallel of Khartum and that of the First Cataract and extending from the Red Sea to the Libyan Desert (Map: Africa, H 3). Vegetation is confined to a few scattered oases and to the very narrow valley of the Nile, which traverses the region in an extremely tortuous course, receiving the Bahr-el-Azrek, or Blue Nile, in the south, and, farther down, the Atbara. The remainder of the country consists of the sandy and rocky wastes known as the Nubian Desert, which toward the south begins to be covered with euphorbias and aloes as it merges into the tropical savanna-lands. The chief products of the oases are dates and gums, the latter derived chiefly from the acacias. The population consists partly of Hamitic and Arabian elements, partly of Nubians. The chief towns of the region are Omdurman, Khartum, Berber, and El-Ordeh on the Nile, and the port of Suakin on the Red Sea.

HISTORY. Nubia was a part of the ancient Ethiopia. The name seems to have been derived from the Egyptian and Coptic *noub*, gold, a name still retained in Wady Nouba. The dominion of the Pharaohs, when most extended, reached to the isle of Argo, the last place where the monuments of the Egyptians have been found. Under these monarchs Nubia was governed by a royal scribe, entitled Prince of Cush or Ethiopia, till the Twentieth Dynasty, when it appears to have been recovered by a series of native rulers, who ultimately conquered Egypt; and although driven back finally extended their rule from Meroë to Syene (Assuan), the most southern city held by the Egyptian monarchs and the Romans. Diocletian removed a negro tribe, called Nobatæ, to the district above Syene, to oppose the Blemmyes, who inhabited the western desert, now held by the Ababde and Bisharin Arabs. The Nobatæ and the Blemmyes intermingled, forming a negroid race which about the middle of the sixth century was converted to Christianity, and under Silko a powerful Christian State was established with Dongola as its capital. The Arabs made little headway against the rulers of the Christian kingdom until the fourteenth century, when Dongola fell, and the country was divided into a number of petty States. It was subdued by Mehemet Ali of Egypt in 1820-22 and remained under Egyptian control until it fell into the hands of the Mahdists in 1884-85. (See MAHDI.) The victories of the Anglo-Egyptian army under Lord Kitchener (1896-98) reestablished the authority of the Egyptian Government over Nubia. See EGYPT; SUDAN. For a description of the peoples of Nubia see NUBIA; NEGRO; HAMITES; and AFRICA, section *Ethnology*.

ÑUBLE, nyōō'blá. One of the best populated provinces of Chile. It is bounded by Linares on the north, Concepción on the west and south,

and Argentina on the east (Map: Chile, C 11). Its area is 3556 square miles. The eastern part belongs to the slope of the Andes, but the western section is generally level, flat, and very fertile. The climate is healthful and favorable for the cultivation of grain. Ñuble is one of the chief wheat-producing provinces of Chile. It affords good pasturage for cattle. The western part is traversed by a railway line. Population, in 1895, 152,935. Capital, Chillan (q.v.).

NUCELLUS (Neo-Lat., from Lat. *nucella*, diminutive of *nux*, nut). The body of the ovule of seed-plants, which is invested by one or two integuments. The nucellus is the essential part of the ovule (q.v.), as it contains the spore (megaspore, later the embryo sac) in which the embryo is developed.

NUCLEOLUS (Lat., little nut). A small body, usually spherical in form, lying within the nucleus (q.v.). See CELL.

NUCLEUS (Lat., little nut, kernel). A small body, usually spheroidal or ellipsoidal in form, which stains deeply and lies within the cytoplasm of the cell. It is generally regarded as a controlling centre of cell activity, and hence as a primary factor in growth, development, and the transmission of specific qualities from cell to cell, and so from one generation to another. In its improperly called 'resting place' the nucleus is globular and surrounded by a membrane. Within it there is an irregular network. The nucleus of certain tissue cells and of some unicellular organisms has been observed to undergo amoeboid movements. In ciliate Infusoria, a large macronucleus and one or more micronuclei may be present in one and the same cell. Besides (1) a nuclear membrane, (2) a network or reticulum, (3) more or less rounded and irregular bodies, the nucleoli, exist in the nucleus, and (4) a clear nuclear sap, or 'karyolymph.' See CELL; EMBRYOLOGY; MITOSIS.

NUDIBRANCHIATA, nū'dī-brān'kī-ā'tā (Neo-Lat. nom. pl., from Lat. *nudus*, naked + *branchia*, from Gk. *βράγχια*, *branchia*, gills). A suborder of opisthobranch gastropods, hermaphroditic, destitute of shell, the primary gills completely aborted, and the secondary gills on the back of the body. Jaws and a well-developed radula are almost always present. The nudibranchs are often called 'sea-slugs' (q.v.). One (*Æolis pilate*) is common on the New England coast just below low-water mark. All the sea-slugs lay their eggs in jelly-like masses coiled up on stones and sea-weeds. Though the adults are shell-less, the embryos at first have a shell, indicating that the nudibranchs have descended from shelled gastropods. See GASTROPODA; and accompanying Colored Plate of SEA-SLUGS.

NUECES, nwā'sēs. A river of southern Texas (Map: Texas, F 5). It rises in Edwards County in a range of low mountains, and flows southeastward for nearly 400 miles through an undulating prairie country, emptying into the Gulf of Mexico through the Bay of Corpus Christi. Under the Mexican régime it was the legal western boundary of the Province of Texas.

NUEVA CÁCERES, nwā'vá ká'thá-rás. The capital of the Province of Camarines, in southern Luzon, Philippines. It is situated at the foot of Mount Isarog, 10 miles south of the Bay of San Miguel, and at the head of navigation for

steamers of 200 tons on the Bicol River (Map: Philippine Islands, H 6). It is an important road centre, a port of entry and telegraph station, and has a cathedral, a bishop's palace, a seminary, and a normal school. Population, in 1896, 11,550. Nueva Cáceres was founded in 1578, and was at first called Naga. It was at one time the chief bishop's see for the whole archipelago.

NUEVA ÉCIJA, á'thè-ná. A province of central Luzon, Philippine Islands. It has an ocean frontage of 23 miles on the east coast of Luzon, and extends westward to the centre of the island, its southwestern corner being 30 miles north of Manila Bay (Map: Philippine Islands, E 4). Its area is 3840 square miles. The numerous river valleys are covered with a rich alluvial soil. The population of the province is essentially agricultural. The chief products are rice, corn, tobacco, and palay. There is a large boat traffic on the rivers, and a network of roads covers the greater part of the province. The population, in 1901, was estimated at 156,610, mostly Tagálogs. The capital is San Isidro (q.v.).

NUEVA ESPARTA. A State of Venezuela, which until 1901 formed a section of the State of Guzman Blanco. It consists of a group of islands, of which the principal is Margarita (q.v.).

NUEVA SAN SALVADOR, nwá'vá sán sál'-vá-dór'. A town of Salvador. See SANTA TECLA.

NUEVA VIZCAYA, véth-ká'yá. An inland province of northern Luzon, Philippine Islands (Map: Philippine Islands, F 3). It has an area of 1075 square miles. Almost the whole of the province is broken by the forest-covered foothills of the Sierra Madre on the east and the Cordillera Central on the west, between which runs the Magat River, a tributary of the Rio Grande de Cagayán. There are practically no manufactures or trade, even agriculture yielding scarcely enough for home consumption. The greater part of the province is inaccessible, and is inhabited by savage tribes, among whom the Igorrotes are prominent. The population in 1901 was estimated at 60,600. The capital is Bayombong (q.v.).

NUEVITAS, nwá-vé'tás. A town of the Province of Puerto Principe, Cuba, on the coast, 39 miles east of Puerto Principe, with which it is connected by rail (Map: Cuba, H 5). It is the most important port of the province, with a population, in 1899, of 4228.

NUÉVO LAREDO, nwá'vò lá-rá'dó. A frontier town of Mexico, situated on the south bank of the Rio Grande, opposite Laredo, Texas. The town is the crossing point between Mexico and the United States of the Mexican National Railroad. Population, 2000.

NUÉVO LEÓN, lá'ón', or NEW LEON. An inland State of Mexico, bounded by the State of Coahuila on the north and west, San Luis Potosí on the southwest, and Tamaulipas on the east and northeast (Map: Mexico, J 5). Area, 23,592 square miles. The State belongs partly to the Mexican plateau and is partly traversed by the Eastern Sierra Madre. In the north and northeast the country is low and slopes toward the Rio Grande. The rivers are numerous, but none of them suitable for navigation. The cli-

mate is not unhealthful, but the rainfall is irregular and droughts occur frequently. The soil is fertile. The chief products are sugar-cane and cereals. Stock-raising is also carried on to some extent. The State has good railway facilities and a considerable trade with the United States and the other Mexican States. Population, in 1900, 326,940. The capital is Monterrey (q.v.).

NUISANCE (OF. *nuissance*, *noicence*, Fr. *nuissance*, from ML. *nocentia*, injury, from Lat. *nocere*, to harm). In common speech, anything which causes unusual and culpable annoyance, disturbance, or offense. As a legal term it is narrower, although scarcely more exact in signification. No definition has been offered which meets with general approval. Perhaps the best brief definition is that of Sir Frederick Pollock: "The wrong done to a man by unlawfully disturbing him in the enjoyment of his property, or, in some cases, in the exercise of a common right." It will be noticed that the gist of nuisance is the unlawful disturbance, annoyance, or discomfort which it produces. Accordingly, the same act may constitute a nuisance and another form of tort, such as trespass; in which case the injured party may seek redress for either of the two wrongs. This distinction has been recognized by English law from a very early period. Glanville, writing late in the twelfth century, and Bracton, writing in the next century, make it clear to us that the 'assize of nuisance,' or trial by jury in an action for nuisance, was distinct from the 'assize of novel disseisin,' as, later, it was distinct from the action of trespass.

PUBLIC NUISANCE. Both of these ancient writers distinguish, as does modern law, between public and private nuisances. The former are offenses against the public at large, such as obstructing highways, polluting or diverting public waters, carrying on a business which is dangerous to the public health or offensive to the public, or maintaining disorderly houses, or indecent or disgusting exhibitions in a public place. Modern statutes have greatly extended the scope of public nuisances, but this legislation professes to observe the common-law test, viz. the tendency of the prohibited act, thing, or conduct to debase public morals, to endanger the health of persons generally, or to interfere unlawfully with their convenience. A public nuisance is a criminal offense and punishable as such by the State. If a legal proceeding is instituted for its abatement, this, too, must be brought and prosecuted by the public authorities. An individual will not be allowed to bring an action in his own name, either for damages or for abatement of a public nuisance, unless he can show three things: first, a particular injury to himself beyond that which is suffered by the rest of the public; second, that such injury is direct and not consequential; third, that it is substantial, not fleeting or evanescent. To illustrate: An unlawful obstruction in a highway constitutes a public nuisance, whether it does actual harm or not; but it will not support a private action by one owning property on the highway unless the latter can show that it has caused him special, direct, and substantial damage, such as diverting customers from his store, or preventing his passing to and from his premises.

PRIVATE NUISANCE. An act or omission constituting a private nuisance is not generally a

criminal offense. It may be, on the contrary, highly beneficial to the community. The tanning of leather, or the manufacture of illuminating gas, or the raising of pigs, is a lawful business and may be quite necessary, but if it is conducted in such proximity to any dwelling as to render the occupancy of it uncomfortable, it amounts to a private nuisance. It is no answer by the owner of such a business that its continuance will benefit thousands of people while harming but one. That one is entitled to the law's protection. Nor is it an answer that his business was established and conducted before I erected my dwelling. If it were, the owner of an offensive (though lawful) business could limit the growth of a city in his direction, or greatly depreciate the value of surrounding property. Still, a particular business will not be accounted a nuisance in one locality which will be considered such in another. A person who erects a dwelling in a locality given up to manufacturing or mining purposes must be deemed to assent to the sights, sounds, and odors of the locality.

Even when the discomfort or annoyance complained of is not a well-established incident of the plaintiff's surroundings, whether it is sufficient in kind or amount to constitute a nuisance is often a difficult question. It is clear that trifling and temporary discomforts must be put up with. The smoke that may, in certain conditions of the atmosphere, descend from a neighbor's chimney, the odors that may be wafted at times from his kitchen, though offensive and disagreeable, are not a nuisance. Between them and the dense smoke and fumes from a kiln or factory that render breathing difficult and produce nauseating sensations there is debatable ground, on which it is difficult to fix the exact point at which smoke and odors and noises become a nuisance in the eye of the law. On the one hand, it is not necessary to prove that they are such as to cause sickness. On the other, it is essential to show that they are of a character to damage property sensibly, or to render ordinary persons actually uncomfortable. Offense to an æsthetic taste or a peculiarly sensitive organism is not enough. The discomfort or annoyance must be that of the average person in the particular situation.

The right to maintain a nuisance cannot be acquired by prescription (q.v.) as against the public; but it may be gained as against individuals. Even in such cases the right is not easily acquired. The one asserting it must show that for twenty years he has continued the very nuisance under a claim of right adverse to that of the person now complaining of it (or of his predecessors in title) with the knowledge and acquiescence of the latter.

In some cases the maintenance of a nuisance may be legalized by statute. The power of the British Parliament in this direction is unlimited. In the United States Congress and the State legislatures are limited by constitutional provisions. A nuisance which amounts to the taking of private property cannot be constitutionally legalized unless due compensation is made to the victim of the nuisance. Even when the nuisance falls short of a taking of property, a statute purporting to legalize it is construed with much strictness. One who justifies under such a statute is bound

to show a clear and unmistakable legislative sanction.

The remedies available to the victim of a private nuisance are three: abatement; a suit for damages; and an injunction. The first he may enforce with or without process of law. For example, he may cut off the boughs of overhanging trees, or pull down a ruinous structure that threatens to fall upon his property. One who thus takes the law into his hands needs to act with great care, for if he does more than is actually necessary to relieve himself of the nuisance, he becomes a wrongdoer himself. If he brings a suit for damages, he is entitled to nominal damages upon proving the nuisance; and in case he shows he has sustained actual damages, he is entitled to those. If the defendant has acted maliciously, he may be compelled to pay punitive damages. (See DAMAGES.) The most efficient remedy, however, is that of injunction (q.v.). Consult: Wood, *Law of Nuisances* (San Francisco, 1893); Garrett, *Law of Nuisances* (London, 1897); Pollock, *The Law of Torts* (ib., 1902).

NUKHA, нукъ-ка'. A town in the Government of Yelizavetpol, Transcaucasia, situated about 150 miles northwest of Baku (Map: Russia, G 6). It is the centre of a silk-producing district. The town is Oriental in appearance. It was formerly the capital of a khanate, and retains the ruins of an ancient palace. Population, in 1897, 24,811, chiefly native Tatars and Armenians.

NÜLL, нүл, EDUARD VAN DER (1812-68). An Austrian architect, born in Vienna. He studied at the Academy, and with his fellow student, August von Siccardsburg, aimed at the promotion of the Renaissance style. Their sojourn in Italy was supplemented by a study trip to France, England, and Germany, and on their return to Vienna Nüll was appointed professor at the Academy. Henceforth associated in the construction of various noteworthy edifices, their joint activity reached its brilliant climax in the erection of the splendid Vienna opera house (1861-68). Before its completion Nüll took his life in a fit of melancholia.

NULLIFICATION (Lat. *nullificatio*, contempt, making as nothing, from *nullificare*, to despise, make as nothing, from *nullus*, none + *facere*, to do, make). In American history, the formal suspension by a State within its territorial jurisdiction of a law of the United States. The right was first asserted in the famous Virginia and Kentucky Resolutions (q.v.) of 1798 and 1799. Jefferson and Madison were the spokesmen of Kentucky and Virginia respectively. In the Kentucky Resolutions of 1798 which were adopted by the Legislature, it was declared that the Union was a 'compact,' and, as in other cases of compact, each party had a right to judge for itself of infractions and of the mode of redress. The resolutions of 1799 went even further, and declared that a nullification by the State sovereignties of all unauthorized acts done under cover of the Constitution was the rightful remedy in cases of infraction. The Virginia Resolutions did not go so far, but characterized the Union as a 'compact' and called upon the other States to join her in declaring the Alien and Sedition Laws null and void. No further action was taken for the time by these or other States to put into execution the methods of 're-

dress' here enunciated. After this there were occasional attempts to defeat the execution of legislative acts or judicial mandates of the United States courts, but with only partial success. Thus in 1809 the Government of Pennsylvania ordered out the militia to resist a mandate of the Federal court. Again, after the enactment of the Embargo Act the governments of several of the New England States, whose commerce and trade had been nearly destroyed, resorted to various means either of judicial construction or evasion to nullify the operation of the United States statute. The second war with Great Britain, which was vigorously opposed in New England, increased the nullification spirit in that section. In several States the operation of Federal enlistment statutes was defeated by the refusal of the State governments to comply with their requirements, and the opposition to the war policy increased to such an extent that a convention was called at Hartford with a view, it was believed, of taking steps toward separation from the Union. (See HARTFORD CONVENTION.) A somewhat successful nullification of the Federal will occurred in Georgia in 1825-29 through the assertion by the State Government of jurisdiction over the lands occupied by the Cherokee Indians. In none of these cases was the constitutional right to suspend a law of the United States made the basis of the violation. The first open assertion of nullification as a constitutional right of each individual State appeared in a paper prepared by John C. Calhoun in 1828 for the use of the South Carolina Legislature, and entitled *The South Carolina Exposition*. In this paper Calhoun argued that the States were sovereign, that the Federal Government was their agent, and that whenever a sovereign State became satisfied that the agent was misusing the powers delegated to it it was the right of such State to interpose and suspend the operation of the power thus being abused. According to this view the State had only to decide that a given statute of Congress was unconstitutional or oppressive, and then, acting through a convention (for Calhoun did not recognize the right of the Legislature in the premises), formally to suspend its further operation within the territory of the State until three-fourths of the States in national convention should declare the suspended act of Congress a valid and reasonable law. In 1830, after the publication of the *South Carolina Exposition*, Senator Robert Y. Hayne (q.v.), from South Carolina, in the celebrated debate with Daniel Webster (on the Foote resolution), made a brilliant defense of the nullification doctrine, and insisted, unlike Calhoun, that the formal act of suspension could be made by the Legislature. The immediate occasion for the assertion of the right of nullification by the two Carolinas was the rapid growth of the system of protective tariffs which, it was claimed, acted injuriously upon South Carolina and the Southern States generally, where manufacturing industries had not gained a foothold. The Tariff Act of 1824, itself containing high protective features, had been followed by the so-called 'tariff of abominations' of 1828, and a tariff act but little less favorable of 1832. The time had now arrived for the trial of the new theory, and accordingly the Governor of South Carolina called the Legislature together for such action as it might deem proper. The Legislature

summoned a convention representing the 'sovereignty' of the State, and on November 24, 1832, this body passed an ordinance declaring the tariff acts of 1828 and 1832 null and void, prohibited the payment of duties after February 1, 1833, forbade appeals, on the questions involved, to the Supreme Court of the United States, and declared that if the Government of the United States attempted to interfere South Carolina would no longer consider herself a member of the Union. The new Legislature, which met in December, put the State on a war footing and passed a series of acts to enable the State officers to carry out the policy of nullification. Meantime President Jackson took measures to enforce the collection of the duties at Charleston, and on December 11th issued his celebrated proclamation warning the people of South Carolina that they were being misled by designing men, whose object was disunion and treason, and that he had no discretionary duty, but must enforce the laws of the Union. Congress came to his aid and passed the so-called 'Force Bill' in March, 1833, but in the meantime a compromise tariff measure had been agreed upon and made further resort to the Force Bill unnecessary. On March 6th the South Carolina convention met and repealed the ordinance of nullification. The conflict was thus postponed, and whether Union or nullification triumphed in this controversy is still a debatable question. Consult: Johnston, in Lalor, *Cyclopædia of Political Science* (New York, 1893); Houston, *A Critical Study of Nullification* (ib., 1896); and Powell, *Nullification and Secession* (ib., 1897).

NULLIPORE (from Lat. *nullus*, none + *porus*, passage, pore). A general name for the more massive coral-like calcareous algae that grow on the outside of coral reefs and thus afford some protection to the more delicate corals growing inside. They belong to the Rhodophycæ. The most important genus is *Lithothamnium*. See CORALLINÆ.

NUMANTIA, nū-mān'shī-ā. The chief town of the Celtiberian people called Arevaci in ancient Spain. It was situated on the Douro (Durius), in the neighborhood of the present Soria in Old Castile. The site is probably marked by the present Puente de Garra. Numantia is celebrated for the heroic resistance which it made to the Romans, from B.C. 153, when its citizens first met a Roman army in battle, to B.C. 133, when it was taken and destroyed by Scipio the Younger, after a siege of fifteen months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. See article SCIPIO.

NUMA POMPILIUS. In the mythic history of Rome, the successor of Romulus. He was a native of Cures in the Sabine country, and was universally revered for his wisdom and piety. Unanimously elected King by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for thirty-nine years, and was a golden age of peace and happiness. The only feature in the myth of Numa Pompilius which we

can regard as probably historical is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

NUMA ROUMESTAN, nu'má rōō'mēs'tān'.

A romance by Alphonse Daudet (1881), and the name of its chief figure, a typical Provençal who has been identified as Gambetta. The thread of the story is the opposition of the northern and southern temperaments, as shown in the light-hearted and irresponsible Numa and his Parisian wife, Rosalie, and is the antithesis in development of the author's happy relations with his northern wife.

NUMBER (OF., Fr. *nombre*, from Lat. *numerus*, number; connected with Gk. *νέμειν*, *nemein*, to distribute, and ultimately with Goth. *niman*, OHG. *neman*, Ger. *nehmen*, obsolete Eng. *nim*, to take). Number is the result of counting or of the comparison of a magnitude with a standard unit. This is more precisely expressed by Newton's definition—the abstract ratio of one quantity to another of the same kind. If a name is attached to the abstract number to indicate the nature of the quantity measured, the resulting number is said to be concrete. Thus, the ratio of the length of a room to one yard may be the abstract number 5; but 5 yards, the measure of the length of the room, is a concrete number. In the evolution of number through the application of the fundamental operations to positive integers, there have arisen the fraction, the irrational number, the negative number, and the complex number. All these kinds of number may be found described in special articles.

Various classifications of numbers, some of which have become obsolete, date from the time of Pythagoras. Among those extant are *odd* and *even*, *prime* and *composite*, *rational* and *irrational*, and *figurate* numbers. The last classification grew out of the Greek tendency to associate numbers with geometric ideas. This notion may be illustrated by arranging groups of dots corresponding to the numbers 3, 6, 10, 15, as shown in the figures.

These forms, being triangular, suggest the propriety of calling the numbers 3, 6, 10, 15, *triangular* numbers. In the same way the numbers 4, 9, 16, 25, came to be called *square* numbers. Since other series of numbers can be made to correspond to pentagons, and still others to various other polygons, the general term *polygonal* numbers was applied to all numbers of this class. An arithmetic definition of polygonal numbers as old as Hypsicles reads, "If as many numbers as you please are set out at equal intervals from 1, and the interval is 1, their sum is a triangular number; if the interval is 2, a square; if 3, a pentagonal; and generally the number of angles is greater by 2 than the interval." Spherical shot piled in the form of triangular pyramids, or square pyramids, or held in cubical boxes suggest numbers which were called *pyramidal* and *cubical*. For example, 4, 10, 20 are pyramidal numbers, and 8, 27, 64 are cubical numbers. The fact that some of these numbers correspond to figures of two dimensions and others to those of three dimensions also gave rise to the classifications *plane* and *solid*. The

numbers in each of these groups belong to a series which has special properties and which is usually discussed in works on higher algebra under the title *Figurate or Polygonal Numbers*. Among the obsolete classifications are *amicable* (q.v.), *perfect*, *defective*, *redundant*, and *heteromecic* numbers. A perfect number is one equal to the sum of its aliquot parts; e.g. $6 = 1 + 2 + 3$. If the sum of the aliquot parts exceeds the number, it is called *redundant*; if it is less, *defective*. A heteromecic number is a number of the form $m(m+1)$.

THEORY OF NUMBERS. This is one of the most intricate and extensive branches of mathematics. It treats principally of the forms and properties of numbers. Thus, many indeterminate problems of the Diophantine type (see **DIOPHANTINE ANALYSIS**) belong to this subject; e.g. to find two numbers the sum of whose squares shall be a square number is a condition satisfied by 5 and 12, 8 and 15, 9 and 40. . . . To find three square numbers in arithmetical progression is a condition satisfied by 1, 25, and 49, or by 4, 100, and 196. Various algebraic formulas serve to express all integers by assigning proper values to the letters involved. Thus by giving to m the successive values 0, 1, 2, 3, . . . $2m$ any of the following groups of formulas: $2m$, $2m+1$; $3m$, $3m+1$, $3m+2$; $4m$, $4m+1$, $4m+2$, $4m+3$, the natural series of numbers results. This is evident since there is one number between every two consecutive even numbers, there are two numbers between every two consecutive multiples of three, three between every two consecutive multiples of four, and so on. By means of such formulas, many properties of numbers may easily be exhibited. E.g. the product of two consecutive numbers is divisible by 2. Let $2m$ be one of the numbers; then the other is either $2m+1$ or $2m-1$; the product, $2m(2m+1)$, contains 2 as a factor, and hence is divisible by 2. The product of three consecutive numbers is divisible by 6. For, let $3m$ be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are $3m-2$ and $3m-1$, or $3m-1$ and $3m+1$, or $3m+1$ and $3m+2$. Each of the three possible products, $3m(3m-2)(3m-1)$, or $3m(3m-1)(3m+1)$, or $3m(3m+1)(3m+2)$, is obviously divisible by 3; and as, besides, at least one of each pair of factors by which $3m$ is multiplied is an even number, the product must also be divisible by 2; but being divisible by 3 and by 2, it is divisible by 6. It may similarly be shown that, in general, the product of n consecutive integers is divisible by $1 \cdot 2 \cdot 3 \cdot \dots \cdot n$, called factorial n . These propositions form the basis of proof for many properties of numbers, such as: the difference of the squares of any two odd numbers is divisible by 8; the difference between a number and its cube is the product of three consecutive numbers, and is consequently always divisible by 6; any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers (thus, $41 = 25 + 16 = 5^2 + 4^2$, $233 = 169 + 64 = 13^2 + 8^2$, etc.). Besides these there are a great many interesting properties of numbers which do not come under any of the common classifications. Thus, the sum of the first n odd numbers equals n^2 ; e.g. $1 + 3 + 5 = 3^2$; $1 + 3 + 5 + 7 = 4^2$, etc.

HISTORY. No essential advance was made in the theory of numbers beyond the knowledge of

the Greeks until the time of Vieta and Bachet (1612). The latter gave a satisfactory treatment of indeterminate equations of the first degree in his *Problèmes plaisants et délectables* (1612; 5th ed. 1884). Fermat (works published posthumously, 1670, 1679) enlarged the theory of primes and proved some of the most elegant properties of numbers. Legendre (1798), in his valuable *Essai sur la théorie des nombres*, epitomized all the results that had been published up to his time, and contributed original and brilliant investigations, especially on the law of quadratic reciprocity. Gauss (1801) called this law the *Theorema Fundamentale in Doctrina de Residuis Quadratis*. It relates to the following property of two odd and unequal prime

numbers: Let $\left(\frac{m}{n}\right)$ be the remainder which is left after dividing $m^{\frac{n-1}{2}}$ by n , and let $\left(\frac{n}{m}\right)$ be the remainder left after dividing $n^{\frac{m-1}{2}}$ by m . These remainders are always $+1$ or -1 . Whatever the prime numbers m and n may be, we always obtain $\left(\frac{n}{m}\right) = \left(\frac{m}{n}\right)$ in case the numbers are not both of the form $4x+3$. But if both are of the form $4x+3$, then we have $\left(\frac{n}{m}\right) = -\left(\frac{m}{n}\right)$. These two cases are comprised in the formula $\left(\frac{n}{m}\right) = (-1)^{\frac{m-1}{2} \cdot \frac{n-1}{2}} \left(\frac{m}{n}\right)$. Propositions embodying this law occupied the attention of Cauchy, Jacobi, Eisenstein, and Kummer. Up to 1890, twenty-five distinct demonstrations of the law of quadratic reciprocity had been published, making use of induction and reduction, of the partition of the perigon (see POLYGON), of the theory of functions, and of the theory of forms.

The theory of primes attracted many investigators during the nineteenth century, but the results were detailed rather than general. Tchebisheff (1850) was the first to reach any valuable conclusions in the way of ascertaining the number of primes between two given limits. Riemann (1859) also gave a well-known formula for the limit of the number of primes not exceeding a given number.

To Kummer is due the treatment of *ideal numbers*, a part of the general theory of complex numbers. They are defined as factors of prime numbers, and possess the property that there is always a power of these ideal numbers which gives a real number. E.g. there exist for the prime number p no rational factors such that $p^3 = AB$, where A is different from p and p^2 ; but, in the theory of numbers formed from the twenty-third roots of unity, there are prime numbers p which satisfy the condition named above. In this case, p is the product of two ideal numbers, of which the third powers are the real numbers A and B , so that $p^3 = A \cdot B$.

The theory of congruences may be said to start with Gauss's *Disquisitiones*. He introduced the symbolism $a \equiv b \pmod{c}$, and explored most of the field. Tchebisheff published in 1847 a work upon the subject in Russian, and Serret did much toward making the theory known in France.

The theory of forms (see FORMS) has been developed by Gauss, Cauchy, Poinset (1845), Lebesgues (1859, 1868), and notably Hermite. In

the theory of ternary form Eisenstein has been a leader, and to him and H. J. S. Smith (q.v.) is also due a noteworthy advance in the theory of forms in general. Smith gave a complete classification of ternary quadratic forms, and extended Gauss's researches concerning real quadratic forms to complex forms. The investigations concerning the representation of numbers by the sum of 4, 5, 6, 7, 8 squares were advanced by Eisenstein, and the theory was completed by Smith.

The theory of *irrational numbers* (see IRRATIONAL NUMBER), practically untouched since the time of Euclid, received new treatment at the hands of Weierstrass, Heine, G. Cantor, and Dedekind (1872). Méray had taken in 1869 the same point of departure as Heine, but the theory is generally referred to the year 1872. Weierstrass's method has been completely set forth by Pincherle (1880), and Dedekind's has received additional prominence through the author's later work (1888), the recent indorsement by Tannery (1894), and, in America, the recent (1901) translation of his work. Weierstrass, Cantor, and Heine base their theories on infinite series, while Dedekind founds his on the idea of a cut (*Schnitt*) in the system of real numbers, separating all rational numbers into two groups having certain characteristic properties. The subject has received later contributions at the hands of Weierstrass, Kronecker, and Méray.

The theory of *continued fractions* (due to Cataldi, 1613) was brought into prominence by Lagrange and further developed by Druckenmüller (1837), Kunze (1857), Lemke (1870), and Günther (1872). Ramus (1855) first connected the subject with determinants, to which phase Heine, Möbius, and Günther also contributed. Dirichlet also added to the general theory, as have numerous contributors to the applications of the subject.

Transcendental numbers were first distinguished from algebraic irrationals by Kronecker. Lambert proved (1761) that π (see CIRCLE) cannot be rational, and that e^a (e being the base of hyperbolic logarithms and a being rational) is irrational. Legendre (1794) showed that π is not the square root of a rational number. Liouville (1840) showed that neither e nor e^2 can be a root of an integral quadratic equation. But the existence of transcendental numbers was first established by Liouville (1844, 1851), the proof being subsequently displaced by G. Cantor's (1873). Hermite (1873) first proved e to be transcendental, and Lindemann (1882), starting from Hermite's conclusions, showed the same for π . Lindemann's proof was much simplified by Weierstrass (1885), still further by Hilbert (1893), and has finally been made elementary by Hurwitz and Gordon.

(Cambridge, 1892). See FRACTION; IRRATIONAL.

TIONAL NUMBER; NEGATIVE QUANTITY; COMPLEX NUMBER; QUATERNIONS.

NUMBERS (Lat. *Numeri*, Gk. *Ἀριθμοί*, *Arithmoi*, Heb. *Bēmīdbar*, in the wilderness, the fourth word of the book), BOOK OF. The fourth book of the Pentateuch. It consists of thirty-six chapters, and receives its common name 'Numbers' from the repeated references to the 'numbering' of the people which it contains. It is not a separate work, but constitutes a division of the group of six books—Pentateuch and Joshua—now designated by scholars as the *Hexateuch* (q.v.). The sources in the book are precisely the same that are found in the other divisions of the Pentateuch, viz. (a) the historical compilation designated as JE (see ELOHIST AND YAHWIST); (b) the Priestly narrative, including portions of the Priestly Code (see LEVITICUS; HEXATEUCH); together with (c) the usual additions and editorial insertions of the group of writers who welded these constituent elements into a consistent whole. The book in its present form falls naturally into three main sections: (a) i.-x. 10; (b) x. 11-xix.; (c) xx.-xxxvi. The first section embraces: (1) the census of the people (i.-ii.); (2) series of ordinances for the Priests and Levites (iii.-iv.), including general and specific duties, positions among the tribes, and census of Levites; (3) various laws—leper, marital jealousy, nazirite (v.-vi.); (4) dedication of altar (vii.); (5) miscellaneous ordinances with illustrative cases (viii.-x. 10). The second section contains: (1) the wanderings (x. 11-28); (2) revolts against Moses by the people, Aaron, and Miriam (xi.-xii.); (3) spies sent to Canaan (xiii.-xiv.); (4) various ordinances (xv.); (5) rebellion of Korah with story of Aaron's selection (xvi.-xvii.); (6) ordinances for priests and people (xviii.-xix.). The third section embraces: (1) continuation of narrative of traditional history in the wilderness (xx.-xxi.); (2) story of Balaam (xxii.-xxiv.); (3) story of cult of Baal-peor (xxv.); (4) second census (xxvi.); (5) groups of ordinances with historical setting and illustrative cases (xxvii.-xxxvi.).

The Book of Numbers thus furnishes an admirable illustration of the method pursued by the Hebrew compilers in combining various historical sources and in using the Priestly Code (from which all the legal portions of the book are taken) as historical material to illustrate and confirm the religious point of view of the later editors and the theory upon which they base their historical narrative, which carries the complete religious organization of Israel back to the days of Moses. See HEXATEUCH.

NUMB-FISH. A torpedo-ray. See TORPEDO.

NUMERALS (Lat. *numeralis*, relating to number, from *numerus*, number). A system of figures or symbols to represent numbers; more particularly the Hindu or Arabic system, which employs the characters 0, 1, 2, ... 9, of which all, or sometimes the last nine, are called 'digits.'

Thus we speak of writing the *numeral* for 'five' meaning '5.' The word, however, is applied to other systems, as in speaking of the Roman numerals or the Greek numerals. Our common numerals come from old Sanskrit alphabetic forms. They appear in the tenth century in the form:

१ २ ३ ४ ५ ६ ७ ८ ९ ०

being attributed to Boëthius (q.v.), but are probably due to some later writer. In substantially this form, they are found in the time of Gerbert (see SYLVESTER II.), written upon counters for use upon one kind of the abacus (q.v.), and bearing the name 'apices.' This form is essentially that of the *Gobar* or *Gubar* (dust) numerals, possibly so called because they were written on the sanded board used in the Orient. These numerals appear among the Western Arabs of that period in the following form written from right to left:

۰ ۱ ۲ ۳ ۴ ۵ ۶ ۷ ۸ ۹

These numerals changed slowly from the time of their introduction into Europe, notably by Gerbert and Leonardo of Pisa (see FIBONACCI), until they had assumed, at the close of the fifteenth century, a form approximately like those known to us. Printed arithmetics then began to appear, and they acted as an obstacle to further changes. These numerals, inherited from the Arabs, have commonly been designated as Arabic, although in their origin they might more properly be called Hindu. Since, however, they were not particularly usable until the introduction of the zero made possible a place value, and since the zero was introduced, so far as we know, by Arab writers, the credit may well be given to the latter. The common numerals are well adapted to the decimal system, having exactly ten symbols. The Roman numerals, on the contrary, while used with a decimal system of counting, were not well adapted to it, and allowed for no simple place value. See NOTATION; NUMERATION.

NUMERATION (Lat. *numeratio*, a counting, from *numerare*, to count, from *numerus*, number). The oral as opposed to the written expression of numbers. Numeration implies the naming of numerals (q.v.) and groups of numerals expressing numbers, the nomenclature thus employed having much to do with the efficiency of the system. Thus, if to every number there corresponded an independent name, a lifetime would not be sufficient in which to learn the numbers from one to a million. The common or decimal system proceeds by using independent names for a few of the smaller numbers and certain groups, and then repeats these names to express various numbers of groups. In this system the fundamental group is ten, independent names are given to the numbers represented by 1, 2, ... 9, 10, 100, 1000, 1,000,000, and all intervening numbers are expressed by combining these names. In the evolution of language the names of a few numbers have lost their suggestiveness, but they are probably not exceptions to the regular system of formation; e.g. the etymologies of eleven and twelve suggest their original meaning to have been *one plus ten* and *two plus ten*.

In reading numbers it is convenient to separate the digits, beginning at the decimal point, into groups of three each. The groups of integers are then expressed by units, thousands,

millions, billions, trillions, etc. Each group of integers includes three orders, viz.: (1) the order of the group itself; (2) the tens of that order; and (3) the hundreds of that order. Similarly, in each group of decimals the three orders are: (1) the order of the group itself; (2) the hundredths of the order of the preceding group; and (3) the tenths of the order of the preceding group. Thus, for example, the number 9,321.34567 is expressed:

Thousands	Units	Thousandths	Millionths
9 thousands	3 hundreds 2 tens 1 unit	3 tenths 4 hundredths 5 thousandths	6 ten-thous. 7 hundred-thous. 0 millionths

Usage has not fully determined the names to be employed beyond hundred millions. The French and Americans call 1000 millions a billion; the English and Germans use the word billion to designate a million million, and so on in groups of six figures.

NUMERICAL NOTATION. In modern music, a system used in theoretical works on music, of indicating single tones or entire chords by means of numerals. Every tone of a musical instrument can be denoted by a numerical sign indicating accurately its pitch. Middle C (the first note of the treble-clef requiring a leger-line *below*, or the first note of the bass-clef requiring a leger-line *above*) is denoted by the small letter *c* with the number 1 placed on the right side above, *c*¹. The tones of the octave below this middle C are indicated by the *small* letters of the alphabet *without* any numbers, *c, d, e, f, g, a, b*; the next lower octave by the *capital* letters, *C, D, E, F, G, A, B*; the octave below this by capitals with the number 1 (either on the right side above, or, better, on the left side below), *,C, ,D, ,E, or C¹, D¹, E¹, etc.* The octave beginning with middle C adds the number 1 to the *small* letters, *c¹, d¹, e¹, etc.*; the next octave adds 2, *c², d², e², etc.*; the next 3, *c³, d³, e³, etc.* This system of notation is especially used in indicating the range of various instruments. The range, therefore, of the piano can briefly be indicated as from *,A—c⁴*. The pitch of the different strings of the violin is accurately indicated by *g, d¹, a¹, e²*; of the cello by *C, G, d, a*.

Arabic figures are also used to indicate the fingering in compositions. For finger-marking on the violin only four numbers are used, as the thumb is not used in playing that instrument. 1 refers to the index, 2 to the middle finger, etc. In marking the fingering of piano compositions the thumb is indicated by 1, the index by 2, middle finger by 3, etc. The older system of marking the thumb by *x*, and the other fingers as in violin-music, has fallen into complete disuse. For use of figures in figured bass notation, see **FIGURED BASS**.

In violin music the Roman numerals I, II, III, IV represent the strings *e, a, d, g*, respectively, but ordinarily Roman figures are employed to indicate chords. A large figure indicates a major, a small a minor, triad. The name of the key is placed before the figure, a capital letter to denote a major, a small letter to

denote a minor key. Thus A IV means the subdominant of A major (a major chord on the fourth degree of A); C III, the minor triad on the third degree of C major; a V, the dominant of A minor (a major triad on the fifth degree). A diminished triad is marked by a small figure with a 0 on the upper right side; an augmented triad, by a prime ('). Thus Dvii⁰ means the diminished triad on the seventh degree of D major (*c[♯], e, g*); fiii', the augmented triad on the third degree of F minor (*a^b, c, e*). Chords of the seventh are indicated as the triads with an Arabic 7 on the lower right side; GV, means the chord of the dominant seventh in G (*d, f[♯], a, c*); bvii⁰, the chord of the diminished seventh in B minor (*a[♯], c[♯], e, g*). This system was introduced by the eminent theorist G. Weber.

NUMIDIA (Lat., from *Numida*, Numidian, nomad, from Gk. *νομάς, nomas*, nomad, from *νέμειν, nemein*, to pasture, to distribute). Originally the Roman name for that part of Northern Africa lying between the provinces of Africa Propria and Mauretania, corresponding very nearly to the modern Algeria. It was bounded on the west by the river Mulucha (now Mulya), which separated it from Mauretania, and on the east by the river Tusca (now Wadi-el-Berber). On the south it reached to the chains of Mount Atlas and the Lacus Tritonis, which separated it from the land of the Gætulians and Libya. The inhabitants of Numidia, as of Mauretania, belonged to the race from which the modern Berbers are descended. They were a warlike race and excelled as horsemen, but were faithless and unscrupulous. Of their tribes, the *Massyli* in the east and the *Massaesyli* in the west were the most powerful. In the great struggle between the Carthaginians and the Romans they at first fought on the side of the former, but subsequently the King of the eastern Numidians, Masinissa (q.v.), joined the Romans, and rendered them effective service in the war with Hannibal. Favored by the conquerors, he united all Numidia under his sway. Of his successors in this kingdom, Jugurtha and Juba I. are the most famous. After the victory of Cæsar over Juba in the African war, Numidia became a Roman province (B.C. 46) under the name of Africa Nova, but Augustus afterwards gave the western part—from the river Ampsaga, now Wadi-el-Kebir—with Mauretania to Juba II., and the eastern part was united with Africa Vetus to form the new Province of Africa. The Emperor Septimius Severus erected Numidia once more into a province. It was conquered successively by the Vandals, the Byzantines, and the Arabs. Before the invasion of the Vandals, Numidia was a stronghold of African Christianity, and the jealousy between the Numidian bishops and the clergy of Carthage was one of the causes that brought about the Donatist Schism. See **DONATISTS**.

NUMIDIAN CRANE. See **CRANE**.

NUMISMATIC AND ARCHÆOLOGICAL SOCIETY, THE AMERICAN. An association organized in 1858 and incorporated in 1865. Its objects are the collection of coins and medals, the investigation of matters connected therewith, and the spreading of the science of numismatology. The society has a membership of three hundred, and its headquarters are in New

York City, where it possesses a valuable collection and a good library of books on numismatics, archaeology, and kindred topics.

NUMISMATICS (from Lat. *numisma*, *nomisma*, from Gk. *νόμισμα*, coin, legal tender, from *νόμιζεν*, *nomizein*, to use customarily, from *νόμος*, *nomos*, law, custom). The science which has for its object the study of coins and medals in their historical, artistic, iconographic, and economic aspects. In so far as it concerns ancient coins, numismatics is a branch of archaeology; but as, in its broadest scope, it includes the coins of all times and peoples, it is a distinct science, wider in its field than any of those branches of investigation which it serves so well to elucidate and expand.

MATERIAL OF THE STUDY. NOMENCLATURE. The material of the study is the *coin* (a word derived through the French *coin*, 'a die,' from the Latin *cuneus*, 'wedge'), which is, strictly speaking, a piece of metal stamped with a legal impress for public circulation. Isidorus (*Origines*, xvi. 17) well expresses this definition: "There are three essentials of a coin: metal, legal type, and weight. In the absence of any of these essentials, it will not be a coin." In its strict application, then, numismatics should confine itself to the legal metallic currency of government, to the exclusion of all else. But there are many objects that bear so close a resemblance in form or in usage to actual coins, that they are naturally and inevitably included in the study. Such are *medals*, struck in commemoration of an event or a person, and not for circulation as money (see *MEDAL*); the ancient *contorniates*, the use of which is not yet fully understood, though they may well have served as checkers in the games; the obscene *spintrix*; the so-called *tessera* of ivory, bone, or lead; and in modern times, siege-pieces; jetons; hard times, tradesmen's, bank tokens, and paper currency, not to speak of such primitive mediums of exchange as the cowry-shells of India and the wampum of the American Indians.

Numismatics has an exact terminology peculiar to its own needs. That side of the coin on which the face or main device is struck is called the *obverse* (Ger. *Hauptseite*, Fr. *droit* or *avers*, It. *diritto*), while the other side is known as the *reverse* (Ger. *Rückseite* or *Kehrseite*, Fr. *revers*, It. *rovescio*). The characteristic device on either side, whether portrait, figure, or scene, is called the *type*. In describing the type, the terms 'to right,' 'to left' refer to the right and left of the spectator. Besides the 'type' there is often a small figure, or adjunct (especially in ancient coins), as a mint-mark, or the like, which serves to identify the coin more closely. This is called a *symbol*. The principal inscription of either side, which may be circular, following the line of the rim, or in one or more lines across the surface, is called the *legend*. That part of either surface left unoccupied by *type* and *legend* is known as the *field*, and is often occupied by symbols, letters, or monograms. The lower portion of the field, separated from the rest by a horizontal line, is the *exergue*. The term *flan* is applied to the disk, or blank, of metal, ready to be coined, and hence to the coin itself regarded as a metallic disk. Thus a coin is said to be struck on a broad or narrow *flan*. The diameter of the *flan* determines the

module, or measurement, of the coin. Three systems are in vogue for measuring coins: (a) the so-called 'Mionnet's scale,' a purely arbitrary method based on circles of varying diameter, used mostly in the older works, and now obsolete; (b) by fractions of the inch; this is the recognized usage in England; (c) by millimeters. The last is the most scientific method, and is in use on the Continent of Europe and largely in this country as well. The weight of coins is often a very important consideration, especially in determining the place of ancient coins. In England the weight is registered in troy grains. On the Continent, however, and largely in America, it is given in grams. One gram is equal to about fifteen grains. *Patina* is a technical term of ancient numismatics. Copper coins that have long lain in the ground, in connection with certain salts there existing, acquire a delicate surface-oxidation, generally green, which is called *patina*, and adds much to the beauty of the coin. Coins so oxidized are said to be *patinated*. There are two ways of making coins: (a) by *casting* in molds, the more primitive method, afterwards mostly confined to counterfeits; (b) by *striking* with dies. Even in the case of *struck* coins, the *flan* is often prepared by casting.

The various *metals* used for coinage deserve a word of elucidation. (A) *Gold* was the standard metal of Asia Minor in the earliest times. It was rarely coined in Greece proper, but was largely minted by Alexander the Great and his immediate successors, by the Egyptian Ptolemies, in the Græco-Bactrian Empire, and at certain West Hellenic cities, as Syracuse in Sicily and Tarentum in Italy. The Romans first coined gold for the payment of their troops engaged in war against Hannibal in Southern Italy (B.C. 216-202). During the Republican period gold was coined only at irregular intervals and in limited quantities. But with Augustus and his successors there were enormous issues of gold currency, until the third century, when it became rare, until again renewed by Constantine and the later Roman and Byzantine emperors. Again, during the Dark Ages, in Europe gold fell into disuse as money, to be revived in modern times. It is now the standard in most civilized countries. (B) *Electrum*, a natural alloy of gold and silver in the proportion, roughly speaking, of 73 parts gold to 27 silver, found in the river-beds of ancient Lydia in Asia Minor, was largely coined by the kings of that country and by the Grecian cities along the neighboring coast, especially Cyzicus and Phocæa. An artificially made electrum was used for coins at Carthage, at Syracuse, and by some of the Gallic chiefs. Electrum has the color of very pale gold, whence it was sometimes called 'white gold' (*λευκὸν χρυσόν*) by the Greeks. (C) *Platinum* was coined extensively instead of gold in Russia from 1828 to 1846.

(D) *Silver* was the earliest, and always remained the standard, coinage of Greece. It was introduced into Rome B.C. 268, and was universal in ancient, as it is in modern, times. During the Middle Ages it was the standard currency, but is now replaced as such by gold in most countries, being used only for subsidiary coinage. (E) *Billon* is a name applied to certain base coins of ancient times, having silver for a basis with a very heavy alloy of copper, tin, or lead. Such were the *denarii* and *antoniniani* substituted for silver at Rome from Caracalla (A.D.

211) to Diocletian (c.300 A.D.), and the base tetradrachms struck during the Roman Empire at Alexandria in Egypt, Antioch, and Cæsarea in Cappadocia. The latter are sometimes described as of *potin*, but see below. (F) *Copper* was the original standard of value in Italy, and remained the only coinage in Rome until the introduction of silver in B.C. 268, when it tended more and more to become a purely subsidiary coinage. In Greece the standard was, and always remained, silver, though here, as in the East, copper was earlier used for the smaller values. The Greeks derived their copper largely from Cyprus, whence its name, *χαλκός κύπριος*, *æs cyprium*, or simply *cyprium* or *cuprum*, from which our word 'copper' is derived. The ancient coined copper had a strong alloy of tin; in other words, was really bronze. See also below, under *Brass*. Copper has since always been in common use for 'small change.' (G) *Potin*, or 'pot-metal,' bears the same relation in numismatics to copper as 'billon' to silver. It is technically a mixture of bronze (i.e. copper + tin) and brass (i.e. copper + zinc), with slight traces, sometimes, of lead or of silver, and was used for money by the Gallic Sequani in the first century B.C., and by the mint of Alexandria in Egypt under the Roman Empire until A.D. 296. Modern numismatic works often erroneously describe the base tetradrachms of Alexandria, Antioch, and Cæsarea as being of *potin* instead of *billon*.

(H) *Brass*, a mixture of copper and zinc, was found in nature and used for coinage under the early Roman Empire and in Asia Minor. It was regarded as more valuable than bronze, and was called *orichalcum* (i.e. *ὀρείχαλκος*, 'mountain copper'), often corrupted into *aurichalcum*, 'gold-copper;' or *χαλκός λευκός*, 'white copper.' In China, brass has always been the ordinary medium of exchange. (I) *Lead*, from its nature, was never well adapted to coinage, yet it was so used occasionally in ancient Gaul and Egypt. It has been a favorite material for counterfeiters at all times, and anciently even the official mints sometimes defrauded commerce by emissions of silver-plated lead coins instead of real silver. The majority, also, of ancient *tesseræ* are of lead. In modern times it is used only for trial pieces and for the cheaper class of medals. (J) *Tin* has only occasionally been used for money, as by the kings of Numidia in the second century B.C., and, according to Aristotle, by Dionysius, Tyrant of Syracuse. In modern times it is found as money among the Chinese, Malays, and Senegambians. (K) *Iron* as money was even rarer than tin in ancient times. We hear of iron coins among the early Lacedæmonians, in Byzantium, in Argos, and elsewhere. (L) *Nickel* was coined in Northern India already in the third century B.C. Otherwise it was never used for money until modern times. Switzerland began to strike nickel pieces about 1850, and since then it has been coined in many countries. (M) *Aluminum* has never served as money, but has frequently been used for medals.

HISTORY OF NUMISMATIC STUDIES. There is no direct evidence that the ancients were collectors of coins as objects of art and curiosity; yet there can be no doubt that many such collections were made. We know that works of art of all kinds found eager collectors in classical

times. We cannot but believe, therefore, that coins also were preserved for their antiquity and their beauty, the more so when we consider the wonderful artistic charm that so many, especially of the Greek series, possess. (See Friedländer, "Ueber Münzsammlungen bei den Römern," in *Zeitschrift für Numismatik*, III. p. 167.) The fall of the Western Empire brought this, as all other manifestations of higher culture, to an abrupt termination.

The revival of classical studies led naturally to an interest in coins. Petrarch, who died in 1374, is said to have been the first modern collector, and sent his objects of art, including coins, as a present to the Emperor Charles IV. Many of the earliest commentators on the classical writers illustrated their notes with figures of coins. Here the knowledge of Roman coins naturally preceded that of the Greek. The first important works on coins did not appear until the sixteenth century. The Italian Andrea Fulvio published in 1517 his *Illustrium Imagines*, with portraits of famous men of ancient times taken from coins and gems. Such collections of coin-portraits became very frequent in the next hundred years. Far more pretentious was the *Fasti Magistratum et Triumphatorum Romanorum* of Hubert Goltz (or Goltzius) of Antwerp—a large folio published at Bruges in 1566; and this he followed at intervals with other works, as histories of Julius Cæsar and Augustus, illustrated by coins. Goltz was a man of learning, but without a high critical faculty, and of so little scientific morality that he did not hesitate to invent at will coins that never existed; and in completing his *Fasti* he created consuls, generals, and private individuals who never lived.

Shortly after the appearance of Goltz's book, Fulvio Orsini (Fulvius Ursinus), a member of the noble Italian family of that name, a man of profound learning, and a great collector of antiquities and coins, published at Rome in 1577 a series of Roman silver coins from his collection of the class commonly known as 'consular' or 'family' coins. This work was highly prized by Scaliger, Ezechiel Spanheim, and Eckhel, who called it 'golden' and 'divine.' Orsini was more careful than Goltz, but many false, or wrongly described coins crept into his work without his knowledge. The book was reëdited in 1663 by the French numismatist Patin. A surfeit of other numismatic books followed, of which, however, it is hardly worth while to cite the names, as almost all are unreliable and useless in the extreme. One alone deserves mention, for it was later worked over into a book of value: the *Numismata Imperatorum Romanorum* of Adolph Oeco, published at Antwerp in 1579. Goltz and Orsini had given their greatest attention to the coins of Republican Rome. Oeco, on the contrary, devoted his work to those of the Empire. The book was scholarly for the period, and collected a vast amount of material. It was reëdited twice at Vienna, in 1601 and 1625; then in 1683 it was entirely done over and published at Milan by Mezzabarba (Mediobarbus); and finally in 1730 a new revision was brought out by Argelati, forming an immense folio, in which the coins are described chronologically reign by reign and year by year. This was the first great attempt at a *corpus* of Roman Imperial coins.

During the seventeenth century we have no

very notable additions to numismatic studies beyond the revisions of earlier works already mentioned. The real labor of this period lay in the gathering into collections of the material for future studies. The works of the French *savant* Jean Tristan, viz. two separate books known as *Commentaires historiques*, published in several editions from 1835 to 1859, deserve mention; as well as the *De Re Nummaria* of Scaliger (1616), the *De Præstantia et Usu Numismatum Antiquorum* of Spanheim (1664), and a series of books on Roman and Greek coins by the explorer and collector Jean Vaillant. One important work belongs to the early eighteenth century, the *Thesaurus Morellianus*, published in 1734 from the manuscript of Andreas Morell by Siebert Haverkamp, which remained for a long time a chief source of information regarding the Roman 'consular' coins. This century saw the immense growth of the great national collections of Europe which have made possible the scientific study of coins. It was, in fact, the curator of the Vienna cabinet, J. H. Eckhel, who may with justice be called the 'Father of Numismatics,' since his marvelous *Doctrina Numorum Veterum* (8 vols., Vienna, 1792-98) placed the study of ancient coins on a thoroughly scientific basis. He was a man of such extraordinary erudition, accuracy, and judgment that even now, more than a century after his death, his *Doctrina* is in every numismatic library and may be consulted with great profit, if also with discretion. Eckhel's method served as a model for future studies, and his material as a starting-point in the classification of ancient coins. With him begins the modern period, the important works of which will be cited below. The real study of mediæval and modern coins is a development of the eighteenth century. For an account of the growth of numismatic studies, see Babelon, *Traité des monnaies grecques et romaines*, I. 66-325 (Paris, 1901).

ANCIENT COINS — ORIGIN — CLASSIFICATION. Among the most primitive peoples some kind of trade or barter was known; and the precious metals were incontestably used as its medium for centuries before the invention of coinage. Excavations in Chaldæa, Babylonia, and Assyria have brought to light very abundant texts in which gold and silver are named as measures of value. In Genesis (xiii. 2 and xxiv. 35) we are told that Abraham was "very rich in cattle, in silver, and in gold," and again (xxiii. 16) that he paid for the cave of Machpelah "four hundred shekels of silver current with the merchant." In all transactions of this early period the metal was weighed, not counted in bars; an operation that appears not infrequently in the pictures on Egyptian tombs.

It was from the Babylonians that the weight systems passed by various trade routes to all the shores of the Mediterranean, and, with the invention of coinage, were subdivided and adapted to the commercial needs of the Hellenic and Hellenized peoples. The Babylonians used a sexagesimal system; thus, in measuring time, 60 seconds = 1 minute, 60 minutes = 1 hour; so in measuring value, 60 shekels = 1 manah, 60 manahs = 1 kikkar. In the course of transmission from east to west this became slightly modified, so that in Greece we find sums reckoned: 50 στατήρες (or, locally, σίγλοι, = shekels) = 1 μνᾶ (i.e. manah), 60 μνᾶι = 1 τάλαντον

(corresponding to the kikkar). For fractions of the στατήρ (or unit) the Greeks developed a duodecimal system, which became the basis of the Greek coinage and so passed to the early Romans, who, however, superposed upon it their own decimal notation. For a concise account of the transmission of ancient measures from Asia to Greece, consult Head, *Historia Numorum*, introduction (Oxford, 1887).

The first coins in the classical world were struck about B.C. 700. Ancient writers differ as to the place that should hold the honor of the invention, but it may be regarded as certain, however, that gold was first coined in Lydia, and silver in Ægina; and specimens of each of these primitive coinages are fairly common. From these early centres coinage spread with great rapidity to the Ionian coast-cities and the islands in the Ægean Sea, as well as to all Greece and the Greek colonies in Sicily, Italy, and elsewhere. For a thorough examination of the origin of money, consult Babelon, *Les origines de la monnaie* (Paris, 1897).

Ancient coins are classified in general according to the system laid out by Eckhel in his immortal *Doctrina*. The whole mass of material is divided into two general classes, Greek coins and Roman coins. (A) The Greek series (or more properly non-Roman, since it includes also Bactrian, Jewish, Carthaginian, Ibero-Spanish, and Gaulish coins, etc.) is classified in geographical order about the basin of the Mediterranean as follows: (1) Spain, (2) Gaul, (3) Italy, (4) Sicily, (5) Macedon, Thrace, etc., (6) Greece, (7) Asia Minor, (8) the East, (9) Egypt, (10) the coast of Africa. Under these various heads the subdivision is alphabetical for cities and chronological for kingdoms. The coins of each mint are then treated in detail, chronologically. By another division, Greek coins are classed as (a) autonomous, or struck by the city-republics; (b) regal, (c) Greek Imperial, that is, the Greek money of those towns which, under the Roman Empire, still retained the right of coinage for local circulation. Here, too, are generally added the Roman colonial coins, or coins with Latin inscriptions struck in a number of towns outside of Italy and Sicily, such as Corinth, Laodicea, and Antioch, in the East, and numerous colonies in Spain and Gaul. But the coins of the late Empire, from the Latin mints of Constantinople, Antioch, Alexandria, etc., are classified with the Roman series.

Roman coins are divided into two general classes: those of the Republic and those of the Empire. The former include the *æs grave*, or earliest heavy bronze coins, and the so-called 'consular' or 'family' coins, with initials or names of magistrates. Properly, these coins, too, should be classed chronologically; but as the dates of most are very uncertain, they are usually arranged alphabetically by families, as *Aburia*, *Accoleia*, *Acilia*, etc., and subdivided under the various names in order of supposed age. The Imperial series, from Augustus to Romulus Augustulus, is classed by reigns, under each of which the coins are arranged either chronologically or by the alphabetical order of the legend on the reverse. The same is true of the Byzantine series. On ancient coins in general, consult: Babelon, *Traité des monnaies grecques et romaines* (Paris, 1901); Hill, *Handbook of Greek and Roman Coins* (London, 1899); Lenor-

mant, *La monnaie dans l'antiquité* (Paris, 1878-79); Eckhel, *Doctrina Numorum Veterum* (8 vols., Vienna, 1792-98); Mionnet, *Description de médailles antiques grecques et romaines* (16 vols., with supplements, Paris, 1806-37); Grasse, *Handbuch der alten Numismatik* (Leipzig, 1853-54); De Barthélemy, *Nouveau manuel de numismatique ancienne*, vol. i. text, vol. ii. atlas (Paris, 1890).

GREEK COINS—GENERAL CHARACTERISTICS—HISTORY. The coins of the ancient Greeks deservedly occupy the first place in numismatic studies for their artistic excellence, which has never been surpassed, their enormous variety, and the light they throw on every phase of ancient Greek life. In the Hellenic world each town was a more or less independent State, and each proclaimed its autonomy by establishing a mint and issuing coins, generally for circulation within its own domains. The types chosen were extremely various, but generally bore some relation to the local cult. It will readily be seen, therefore, how much we are indebted to coins for our exact knowledge of the religion, mythology, art, and monuments of the ancient Greeks. This will be illustrated briefly in the following section, in which the history of Greek coins will be explained with reference to their types. A short preliminary account of the various denominations, considered purely as money, will not be without value. In the early gold and electrum coinage of Asia Minor the unit was the *στατήρ*, *statēr*, or 'standard,' with its divisions, the half-stater (*ἡμιστάτηρ*, *hēmistatēr*), third (*τρίτη*, *tritē*), sixth (*ἑκτὴ*, *hektē*); and its multiple, the *διεσάτηρ*, *diestatēr*, or double stater. From their place of emission or from the name of the reigning king they received such names as *Κυζικηνόι*, *Λαμψακηνόι*, *Φοκαίων* (staters of Cyzicus, Lampsacus, Phocæa), *Κροίσειος στατήρ* (stater of Cræsus), *Δαρείου στατήρ* or *Δαρείος* ('daric' of King Darius), etc. The Persian silver coin was called *στέγλος* (*siglos*, silver daric), which is the Greek form of the Hebrew *shekel*, shekel, which was a unit of count in Palestine until actually coined by Simon Maccabæus. In Greece the unit of count was the silver *δραχμή*, *drachmē*, which in its origin was probably the value in silver of the grain that could be placed (a 'handful,' *δράβ*) upon one of the scales of the balance. Consequently the two equiposed handfuls, or *δραχμαί*, formed a new 'standard,' or unit of count, a *στατήρ* corresponding to the double drachme (*δίδραχμον*, or silver stater). The Greek subdivision was duodecimal, as follows: the *στατήρ* or silver didrachm was divided into twelve *ὀβολοί* or obols; and for small change the obol itself was divided into 'portions' known as *τριηταρτημόριον* ('three-fourths portion,' contracted to *τριημόριον*, *tritēmōrion*), *τριμυτάρτημόριον* ('three-eighths portion'), *τεταρτημόριον* ('fourth portion,' contracted to *ταρτημόριον*, *tartēmōrion*), and *ἡμιταρτημόριον* ('half-fourth portion,' or one-eighth obol). These names, with those of multiples of the drachme, were applied in different States to coins of interchangeable value in gold, silver, and copper, of which the following are the more important: (A) Multiples of the drachme. *Δωδεκάδραχμον*, *dōdekadrachmon*, a silver piece of twelve drachms, coined by the Ptolemies in Egypt and at Carthage. *Δεκάδραχμον*, *dekadrachmon*, of ten drachms, in gold and silver at Athens, at Car-

thage, and in Egypt. The so-called silver 'medallions' of Syracuse are *pentekontalitra* (see below), equivalent to Attic dekadrachms. *Ὀκτάδραχμον*, *oktōdrachmon*, of eight drachms, coined in gold and in silver by the Ptolemies, in gold by the Seleucids, and in silver in Thrace and Carthage. *Ἑξάδραχμον*, *hexadrachmon*, of six drachms, coined perhaps in gold by the Seleucids, certainly in silver at Carthage. *Πεντάδραχμον*, *pentadrachmon*, of five drachms, of the Ptolemies in gold, and of the kings of Macedon in silver. *Τετράδραχμον*, *tetradrachmon*, in English *tetradrachm*, of four drachms, a silver coin of universal usage. *Τρίδραχμον*, *tridrachmon*, of three drachms, in silver, at Ephesus, Carthage, Cyme, Alabanda, and elsewhere. *Δίδραχμον*, *didrachmon*, in English 'didrachm,' the silver stater, in universal circulation, like the drachm itself. (B) Divisions of the drachme. *Ἑπτὰὀβολος*, *heptōbolos*, of seven obols (1.1-6 drachms), the large copper coin of Egypt, struck under Ptolemy Philadelphus. *Ἑξάὀβολος*, *hexōbolos*, copper of the second size of Ptolemy Philadelphus. *Πεντὰὀβολος*, *pentōbolos*, of five obols (5-6 drachm), struck in silver in Athens in the time of Aristophanes the comedian, and in copper of the third size in Egypt. *Τετράὀβολος*, *tetrōbolos*, of four obols, a silver coin at Athens in the fifth century B.C. *Τριὰὀβολος*, *triōbolos*, of three obols, as a gold coin in Egypt and Carthage; as a silver coin = the *ἡμιδραχμον*, hemidrachm, found everywhere. *Διὰὀβολος*, *diōbolos*, of two obols, in silver everywhere, in bronze in Egypt. *Τριμυτὰὀβολος*, *tri-hēmioōbolos* (i.e. 1½ obols or 1¼ drachm), in silver at Athens, Corinth, Leucas, Tegea, etc. *Ὀβόλος*, *obolos*, the small unit, very common as a silver coin; in bronze in Egypt, at Chios, Metapontum, etc. *ἡμιὀβόλος*, *hēmioōbolos* (½ drachm, ½ obol), also very common in silver. The smaller divisions are rarer. The *tritēmōrion* (¼ obol) is found in silver at Athens, Delphi, etc.; the *tartēmōrion* (⅛ obol) at Athens and under Alexander the Great in silver, at Metapontum in copper; the *hemitartēmōrion* (⅙ obol) also at Athens in silver, at Metapontum in copper. In the Greek cities of Sicily and Italy the name *σέρμης* or *σέρμος* was given to a silver coin of frequent mintage, similar to the Grecian didrachm or stater. But the Greeks of the West adopted also the native Sikel unit of the *λίτρα*, *litra*, equivalent to the ancient 'pound' of copper, divided into twelve *ὀγκύαι*, *oungkiai*, or ounces, whence the Romans derived their earliest system of the *as grave*. (See below.) On the litral system, a number of fine silver coins were issued, as the splendid 'medallions' of Syracuse, the most artistic coins ever struck, which are *πεντηκοντάλιτρα*, or pieces of fifty *λίτραι*, and the famous *Δημαρτήρια* of Queen Demarete; also *δεκάλιτρα* in Sicily, *πεντάλιτρα* at Agrigentum, and *δίλιτρα* at Rhegium.

To give an adequate description, even in general terms, of Greek coins as works of art and as historic documents would require a volume; the reader is referred for fuller information to the bibliography appended to this section. For convenience of classification and study, the whole series is arranged in seven historic periods, as follows:

- I. c.700-480 B.C. (*Period of Archaic Art*).
- II. c.480-415 B.C. (*Period of Transitional Art*).
- III. c.415-336 B.C. (*Period of Finest Art*).
- IV. c.336-280 B.C. (*Period of Later Fine Art*).

(Numbers 10, 11, and 12 are reduced in size)

V. c.280-146 B.C. (*Period of the Decline of Art*).

VI. c.146-27 B.C. (*Period of Later Decline*).

VII. c.27 B.C.-268 A.D. (*Imperial Period*).

FIRST PERIOD—Archaic Art. This embraces all the coins struck from the beginning until the Persian War. Here belong the early gold and electrum coins of Asia Minor, of which the most primitive of all is the electrum stater of Lydia, attributed to the period of Gyges and Ardys (B.C. 700-637), which is without figures, the obverse having merely a series of sunken parallel lines, or striations, and the reverse a rough triple punch-mark. From this beginning we find a gradual development in style and technique. The punch-mark is long retained for the reverse, but it is gradually embellished, first by being divided geometrically, then by the addition of a small figure in relief within the sunken space. The types are generally animal figures or heads. Where the human head appears (for a divinity), the eye is shown in full, though the face be in profile, and the hair is represented by dots. The whole appearance of the figure is apt to be stiff and angular. In Magna Græcia (Southern Italy) the punch-mark is not found; instead, the same type appears on both sides of the coin, in relief on the obverse, concave (or, as it is technically called, *incuse*, i.e. 'struck in') on the reverse. Inscriptions are either wholly lacking or limited to the first letters of a name.

SECOND PERIOD—Transitional Art. This extends roughly from the Persian War to the Athenian expedition against Syracuse (B.C. 415). The coins show a decided advance in style over those of the preceding period. The *incuse* square, or punch-mark, is still often retained, but is much more regular, and more frequently has a device in relief within. The figures are more accurate and varied, with greater attention to anatomical detail. Inscriptions are the rule instead of the exception, but are generally abbreviated, though sometimes names and even titles are written in full. The types are of infinite variety and often quite complex, but almost invariably drawn from the local mythology.

THIRD PERIOD—Finest Art, to the accession of Alexander the Great (B.C. 336). The coins of this period, the finest that the world has yet produced, reflect the art of the greatest Greek sculptors. In fact, the die-engravers often signed their names to their works of art, notably at Syracuse. The type, whether head, figure, or group, is in perfect proportion and exquisitely adapted to the limited space. The subjects are still drawn almost universally from mythology, though the splendid *bigæ* and *quadrigæ* of certain cities bear allusion often to victories in the national games.

FOURTH PERIOD—Later Fine Art, extending to the death of Lysimachus, King of Thrace (c.280 B.C.). This period, corresponding to the art of Lysippus, illustrates the rise and perfection of portraiture. Alexander the Great himself hesitated to offend the religious susceptibilities of his subjects by substituting his own likeness for that of a divinity on his coins, which bear regularly the head of Zeus Ammon or Herakles or some other god. But his successors little by little introduced their own portraits; and we thus have in the succeeding periods a splendid series of wonderful likenesses of the rulers of the Greek world in the last three centuries be-

fore Christ, notably the Syrian Seleucids, the Ptolemies of Egypt, and the Macedonian and Bactrian monarchs.

FIFTH PERIOD—Decline of Art, to B.C. 146, the fall of Corinth and conquest of Greece by the Romans. An age of magnificent portraiture; but as regards fabric the coins are broad and flat, with long inscriptions that mar the symmetry of the reverse type, which, too, displays always greater carelessness of details. Coins can now be more accurately dated; in fact, many bear the date and place of mintage in letters or monograms.

SIXTH PERIOD—Later Decline of Art, to the foundation of the Roman Empire (B.C. 27.) This period signalizes the end of the distinctly Greek coinages. It is characterized by base silver coins, often with fine portraits still, but crude in workmanship. The names of local magistrates are extremely common and of great historical value. The inartistic *cistophori* are in general circulation in Asia Minor. In the farther East the Bactrian money loses its Greek character and becomes Oriental.

SEVENTH PERIOD—The Greek World Under Roman Sway. The Romans partitioned the Greek world into provinces, which were governed by agents sent out from Rome. But while the general management of the provinces was controlled from Rome, the greatest possible degree of home rule was left to the thousands of Greek towns scattered over the old Hellenic world from Parthia to Egypt. Each one of these towns was allowed to retain its local mint and issue bronze coins; while the special privilege of issuing base silver ('billon') tetradrachms was limited to Antioch in Syria, Caesarea in Cappadocia, and Alexandria in Egypt. These coins generally bear the head of the Roman Emperor, and a reverse type of local significance, in a very degraded style of art. The local mints were all closed under Gallienus (c.268 A.D.), with the exception of Alexandria alone, which retained its privilege until A.D. 296.

The standard work of reference on Greek coins is Head, *Historia Numorum* (Oxford, 1887). See also: Head, *Guide to the Principal Gold and Silver Coins of the Ancients* (London, 1881); Gardner, *Types of Greek Coins* (Cambridge, 1883); British Museum, *Catalogue of Greek Coins*, in many volumes by different editors; Bibliothèque Nationale, *Catalogue des monnaies grecques*, by various editors; Macdonald, *Greek Coins in the Hunterian Collection, University of Glasgow* (Glasgow, 1899-1901); Imhoof-Blumer, *Monnaies grecques* (Paris, 1883); Ward, *Greek Coins and Their Parent Cities* (London, 1902).

ROMAN COINS—History and Characteristics. The Italic peoples of Central Italy were a pastoral race, and their earliest medium of exchange was cattle (*pecus*); the Latin words *pecunia*, 'money,' *peculium*, 'property,' and *peculatus*, 'stealing,' are evidence of this. Bronze was the only metal that they possessed in quantity and used for implements, weapons, and ornaments; it thus furnished a convenient substitute for cattle in barter, and in fact for some centuries after the founding of Rome, *as rude*, or shapeless pieces of bronze, to be weighed with each transaction, were the only 'money.' Thousands of these have been found, notably in sacred springs and in tombs, where they were thrown as votive offerings or deposited out of respect for the dead.

The real coined money of the Romans began with the *Æs GRAVE*, or heavy bronze, which seems to have begun about B.C. 350, though some have wished to place its origin as far back as the decemviral legislation (B.C. 450). The duodecimal system of the *æs grave* was adopted from the Greeks of Southern Italy and Sicily, whose 'pound of copper,' or *λίτρα*, of twelve 'ounces' (*οβύλια*) became the Roman *libra* of twelve *uncia*. The *libra* thus became the unit of count (*as*), and as such was coined, a large and bulky copper (bronze) piece, which, however, seldom exceeds ten ounces, and is generally less. The earliest *as* and its divisions bear no letters whatever, but the value is marked by dots. The reverse type is always the prow of a ship. The obverse types of the various denominations differ as follows: *As*, double head of Janus with 1 (unit); *semis* ($\frac{1}{2}$ *as* = 6 *uncia*), head of Jupiter with S; *triens* ($\frac{1}{3}$ *as* = 4 *uncia*), head of Roma with four dots; *quadrans* ($\frac{1}{4}$ *as* = 3 *uncia*), head of Hercules with three dots; *sextans* ($\frac{1}{6}$ *as* = 2 *uncia*), head of Mercury with two dots; *uncia* (1-12 *as*), head of Roma with one dot. These remained the fixed types of Roman bronze money during the whole Republic. All these coins are cast (not struck), and are of rude fabric. There is also an enormous series of *æs grave*, coined on the Roman system, but of even greater size, with the most diverse types, by the many Italic tribes of Central and Northern Italy.

But while the Romans at home were content to use their cumbersome bronze coins, their generals operating in Campania and Apulia struck coins on Greek systems, in silver as well as copper, and far finer in technique. These bear at first the name *Romano*, afterwards *Roma*, and are known as *Romano-Campanian* coins. They were not intended for circulation in Rome. A great reorganization of Roman coinage took place in B.C. 269-268, after the successes over the Samnites, Pyrrhus, and the Tarentines. The bronze *as* and all of its divisions were reduced to one-third of their former weight and size (so that the *as* now contained only as much metal as the earlier *triens*), and at the same time multiples of the *as* were coined in silver; the silver coins along with the smaller divisions in bronze (*sextans* and *uncia*) being struck, the others still cast. The silver coins were the *denarius* (1-72 of a pound of silver; equivalent to ten reduced *asses*), *quinarius* (of five *asses*), and *sestertius* (of $2\frac{1}{2}$ *asses*). The silver coins have all the same types: obverse, head of Roma, with winged helmet, and sign X (= ten), V (= five), IIS (= $2\frac{1}{2}$), respectively; reverse, the Dioscuri galloping to the right, with the name *Roma*. Shortly afterwards other reverse types were introduced, as Victory or Diana in a chariot. There was also a very slight emission of bronze multiples of the *as*, namely, the *decussis* (ten *asses*), *tripondius* (three *asses*), *dupondius* (two *asses*). But even now the bronze coinage, which was still the backbone of the Roman monetary system, tended gradually to diminish in weight. The *as* was reduced to the weight of the original *quadrans*, then to the *sextans*; and finally, in B.C. 217, under the pressure of the crisis produced by the invasion of Hannibal, the *Lex Flaminia* ordained a new reorganization of Roman finances. The *as* was reduced to the size of the original *uncia*, and the *denarius* was coined at 84 to the *libra*

of silver, instead of 72. This changed the relation of silver and copper coins, and the *denarius* equalled 16 *asses* instead of 10. From henceforth all coins are struck.

The right of coinage, which at first was vested in the consuls and other magistrates, was now confined to a special board of *triumviri monetales* (though at first the board of moneyers was not limited to three), and these early began to place their initials, monograms, or names upon their coins. We thus have a long series of coins (the so-called 'family' or 'consular' series) bearing the most noble names in Roman history from the third century B.C. to Julius Cæsar, Pompey, Brutus, Cassius, and M. Antonius. About B.C. 150 the types begin to be very various on the silver coins, each moneyer following his own whim in recording family traditions, religious cults, or historical events. In B.C. 91 the great uprising broke out which is known as the Social War. Many tribes of Central Italy declared themselves independent of Rome, and formed an offensive and defensive alliance against Rome, striking coins with the name of their leader, Q. Pompædus Silo, with the type of the bull of Italy crushing the serpent of Rome, and with the name of their new republic, Italia, in Oscan or Latin letters. It required years for Rome to subdue this powerful union, and in B.C. 89 a financial crisis was again averted by the expedient of reducing the coinage. The silver was not changed, but the *as* was made equal to the *semuncia* ($\frac{1}{2}$ *uncia*). This is called the *semuncial* system. This was the last change under the Republic. Gold had not heretofore been coined in Rome (though gold pieces of 20, 40, and 60 sesterces, with *Roma*, had been struck after B.C. 217 in the Romano-Campanian series); in the last century of the Republic, however, there were numerous emissions of *denarii aurei* (or simply *aurei*), which, like the silver coins, bear the names of magistrates and generals, as Sulla, Pompey, and Cæsar. It was Julius Cæsar who first placed his portrait on a Roman coin.

The standard work on coins of Republican Rome is Babelon, *Description historique et chronologique des monnaies de la république romaine* (2 vols., Paris, 1885). With this compare Bahrfeldt, *Nachträge und Berichtigungen zur Münzkunde der römischen Republik* (Vienna, 1897, with supplementary volume, 1900). Consult, also, Garucci, *Le monete dell' Italia antica* (Rome, 1885).

With Augustus Cæsar begins the coinage of the Empire, a long and important series with an infinite number of varieties in gold, silver, and bronze. Augustus took under his personal charge the coinage of gold and silver, leaving the bronze to the Senate; wherefore bronze coins from now till the third century bear the letters S. C. (*senatus consulto*, 'by order of the senate'). The obverse of Imperial coins generally bears the ruler's head, with his name and titles; the reverse has a varying type (deity, personification, group, monument, or the like), with explanatory inscription or continuation of Imperial titles. The denominations are: in gold, *denarius aureus* (or simply *aureus*), equal to 25 silver *denarii*, and its half, the *quinarius aureus*; in silver, the *denarius*, equal to four *sestertii*, and the *quinarius*, of two *sestertii*; in bronze, the *sestertius* (so-called 'large-bronze'), of four *asses*, *dupondius*, of two *asses* ('middle bronze'), *as* ('middle

bronze'), *semis* (half-as, so-called 'small bronze'), and *quadrons* (quarter-as, also so-called 'small bronze'). The *sestertius* and *dupondius* are of yellow bronze (orichalcum), the *as* of red bronze. Further, the *dupondius* and *as*, which are almost of a size, are generally distinguished by the fact that the former has the Imperial head with radiate or spiked crown—the latter with laurel wreath. Down through the Antonine period we have a splendid series both artistically and technically, but from the reign of Commodus (180-192) coins begin to be debased both in quality and fabric. The *denarius* especially began to be small and of base metal, so that Caracalla introduced a new silver coin, the *antoninianus*, or double *denarius*, distinguished by the radiate crown for emperors, and a crescent at the neck for empresses. From this time all coins (except gold, which is rare) were more and more debased. Billon superseded silver, or the *denarius* became a copper coin washed with silver. The larger bronze coins, *sestertius*, *dupondius*, *as*, disappeared forever. Under the later Empire mints were opened in all parts of the Roman world, and the sign of the mint appears on the coin, as *PLON* (*pecunia Londinensis*, mint of London), *SMANT* (*sacra moneta Antiochensis*, mint of Antioch) etc. Constantine (A.D. 312) fixed the gold unit at 1/72 of a pound, and named it *solidus*, with divisions, the *semis* or half, and *triens* or third. He reestablished silver coins, notably the *miliarensis* and the *siliqua*; and coined in bronze the *maiorina* and *centenionalis*. These coins endured till the fall of the Western Empire. The art of the Roman coins is best expressed by their portraiture. During the first two centuries the portraits are masterpieces; in the third century they are either gross or brutal; and in the fourth and fifth they are unnatural and absurd.

The reference work on Imperial coins is Cohen, *Description historique des monnaies frappées sous l'empire romain* (2d ed., Paris, 1880-90). Consult also: Stevenson, *Dictionary of Roman Coins* (London, 1889); Gneccchi, *Monete romane* (Milan, 1896); Blanchet, *Les monnaies romaines* (Paris, 1896).

MEDIAEVAL AND MODERN COINS. There is no sharp line of demarcation between ancient and modern coins, but the Byzantine series, which continues the mintages of the Eastern Roman Empire, is a natural link. Byzantine coins are: in gold, the *solidus*, with its half and third; in silver, the *siliqua*, with its half and quarter; in copper, the small unit, without sign of value, the *nomisma* (marked ϵ = 5), *centenionalis* (marked ι = 10), *denarius* (marked κ = 20), and the *folles* (marked μ = 40). The workmanship is generally crude. After the tenth century the portrait of the Emperor is supported by some patron saint. The reverse has such types as Victory with a cross, afterwards a representation of the Saviour or the Virgin. Latin is gradually superseded by Greek in the inscriptions, and wholly disappears by the time of Alexius I. (1081-1118). The series continues until the overthrow of Constantine XIV. Palæologus by the Turks in 1453.

Consult Sabatier, *Monnaies byzantines* (2 vols., Paris, 1862).

In the West the coins of the barbarian States founded on the ruins of the Roman Empire retained the form and style of the late Roman

coins, though becoming always more degraded in art and fabric. Latin is the universal language. The principal coins in circulation in the early middle ages were the silver *denarius* and its half, the *obol*. It will be possible here to treat the development of coinage in modern times only in a very summary way. With the rise of barbarian kingdoms in Italy, Spain, and Africa, we have coins in silver and copper (rarely gold) of the Ostrogoths, Visigoths, and Vandals. The Visigothic coinage in Spain extends from Leovigildus (573-586) to the overthrow of Roderic by the Arabs in 711. A Moorish coinage now begins in Spain, with the peculiarity of Arabic on one side and Latin on the other, and bearing dates both according to the Hegira and according to the old Roman indictional system. These coins are numerous in the eighth century. Consult Codera y Zaidin, *Tratado de numismática arabigo-española*.

In England the Anglo-Saxon coinage begins in the seventh century, and though also a development of the late Roman coins, it shows little resemblance to them. The two chief coins are the silver *skeatta* and the copper *styca*. The little gold coin of Peda, or Peada, King of Mercia (655-656), is notable as having runic letters along with the Latin. The coins of Offa, King of Mercia (757-796), and of Alfred the Great (871-901) are especially characteristic. The Merovingian kings in Gaul begin to strike coins under Theodebert I. (534-538). There are gold *solidi* and *trientes*. A fine gold piece of Dagobert (622-638) is perhaps the best of the series. The Carolingian coins begin with Pepin (752-768), and are most common in the gold *triens* and silver *denarius*. Of Charlemagne (768-814) the coins are numerous, and often have a good likeness. On Merovingian coins consult: De Belfort, *Description générale des monnaies mérovingiennes* (Paris, 1892). On Carolingian coins: Gariel, *Les monnaies royales de France sous la race carolingienne* (Strassburg, 1883-85). In Italy the coinage of the Lombards begins during the Merovingian period in France, with numerous issues in Milan, Benevento, and Salerno, always with the flat flans and crude fabric of the period. For the coins of the early Middle Ages in Europe, consult: Engel et Serure, *Traité de numismatique*, vol. i., Paris, 1892. Papal coins, a long and interesting series, begin with Hadrian I. (772-785) and extend to Pius IX. Consult: Cinagli, *Le monete dei Papi* (Ferraro, 1848). The coins of the German rulers of this period often have on the reverse the name and emblems of a bishop. To the tenth century belongs the earliest coin with a German inscription, a *denarius* struck at Gittelde, near Brunswick, reading "*hir steid te biscop*" (*hier steht der Bischof*), with bishop's portrait, and "*lelithis pening*" (*Pfennig of Gittelde*). The word *pening* was now the general name in Germanic countries for *denarius*, whence English *d.* = *penny*. On mediæval German coins, consult: Cappe, *Die Münzen der deutschen Kaiser und Könige des Mittelalters* (Dresden, 1848-57). In Norway and Sweden in the eleventh century we have *denarii* or *pennies*, with inscriptions in runic or Latin letters, and in Swedish or Latin, or both together. The coins of the Danish kings in England, Cnut for instance, have purely English legends, as do also those of contemporary Irish princes, as Sitric III., King of Dublin (989-

1029). On the Continent, in the twelfth and thirteenth centuries, the *denarii* were struck on a broad flan, so thin that even with low relief it was impossible to stamp them on both sides. Such coins are known as *bracteates*, from Latin *bractea*, a thin, flat piece of metal, and were commonly struck by the German princes, of whom the first was Conrad III. (1138-52). Those of Frederick Barbarossa are very numerous and often beautiful of their kind. Polish coinage begins with the introduction of Christianity under Miecislav I. (c.965-992). The style and fabric is like the German coins of the same epoch, but the inscription is often in Russian letters. Russian coins begin under Vladimir, who died in 1015. Consult: Tolstoy, *La numismatique russe avant Pierre le Grand* (Saint Petersburg, 1884). The coinages of the thirteenth century are notable for the large number of gold pieces. Here begins the splendid series of gold *florins* of Florence and *sequins* (or *ducats*) of Venice, which show an advance in style that rapidly spread to other parts of Europe. The doges' coins extend with little change from Giovanni Dandolo (1279-89) to Ludovico Manin (1797). For Italian coins, consult: Promis, *Tavole sinottiche delle monete battute in Italia* (Turin, 1869). In the fourteenth century the coinage in gold and silver is vastly improved, the broad, flat pieces being very rich in ornamentation, especially the French silver *tournois* and gold *mouton*, the German silver *groschen*, and the English gold *noble*, or *rose-noble*. The fifteenth century continues the *gulden*, *florins*, and *ducats* of the previous epoch. The *bracteates* are still found, but small and poor. A new type of money is now introduced at Joachimsthal in Bohemia, a broad, flat silver coin, which quickly spread over all Germany and received from its first place of mintage the name *Joachimsthaler*, soon abbreviated to *thaler* (the origin of our American name *dollar*). The earliest dated *thaler* is that of Duke Sigismund of Tyrol, 1484. The broad *thalers* of the fifteenth and sixteenth centuries are real medallions of art, and this is true also of many of the contemporary coins of Italy, which are the work of artists of the first rank, as Francesco Francia of Bologna and Benvenuto Cellini. With the dating of coins the really modern period now begins; portraits are especially fine, and values are placed on the various pieces. The types are limited in variety and the historic value of coins is largely transferred to medals. Oriental coins have an origin quite independent of the European series. In China, some kind of coinage is said to have existed in the third millennium B.C. The earliest coins known are of brass, and have the form of 'trousers,' 'razors,' or squares. A peculiarity of later Chinese brass coins ('cash') is the square hole in the centre, for ease in carrying on strings. Consult: Terrien de Lacouperie and Poole, *Catalogue of Chinese Coins* (British Museum) (London, 1892). In Japan, in the seventeenth century, there were the oval gold *koban* with mint-stamps, the oblong gold and silver *itzebu*, and the oval brass *tempo*, the latter having the square hole for stringing, like the Chinese 'cash.'

NUMMITOR. See ROMULUS.

NUMMULITES, nūm'mŭ-lĭtĕz (Neo-Lat. *nummulus*, diminutive of *nummus*, coin). A genus of vitreo-calcareous foraminifera that secrete a lenticular shell composed of many whorls coiled in a flat spiral. At the present time Nummulites is represented by only a few species that live in the shallow water of warm seas, but during ancient geological times, especially during the Tertiary, it was of great importance, for its shells formed limestone formations often hundreds of feet in thickness. These massive nummulite limestones are prominent features in some parts of the Alps, and they occur also in the north of Africa, in Asia Minor, Persia, India, China, and Central America. An allied genus, *Orbitoides*, is common in the Eocene beds of the Southern United States. See article FORAMINIFERA.

NUN. See MONASTICISM; SISTERHOODS.

NUN-BIRD. (1) A puff-bird. (2) Any of several species of titmouse. (3) A variety of domestic pigeon. In each case the colors of the plumage suggest the name.

NUNC DIMITTIS (Lat., now lettest thou depart). The name given, from its opening words in the Latin version, to the canticle of Simeon (Luke ii., 29-32), which forms part of the compline office of the Roman breviary, and in the evening service of the Anglican Church follows the second lesson.

NUNCIO, nūn'shĭ-ŏ. See LEGATE.

NUNEATON (nūn'-ā-ton) **AND CHILVERS COTON.** A manufacturing and market town in Warwickshire, England, on a tributary of the Anker, 8½ miles northeast of Coventry (Map: England, E 4). The town has the interesting Gothic Church of Saint Nicholas, the new Church

of Saint Mary embodying the remains of a twelfth-century priory of nuns, two endowed schools, a free library, and a literary institute. It owns water-works and electric lighting plants. It has noted ribbon manufactures, worsted, cotton, and elastic weaving industries, iron works, and tanneries. Coal is mined in the vicinity. During the nineties Nuneaton and Chilvers Coton amalgamated under one municipal council. Population, in 1891, 15,300; in 1901, 25,000.

NUÑEZ, *nũnyäs*, **RAFAEL** (1825-94). A South American statesman, President of Colombia. He was born in Cartagena; entered politics as a member of Congress in 1851; was twice (1855-57 and 1861-62) Secretary of the Treasury; and was a prominent journalist and editor, being director for two years of *El Continental*, a Spanish newspaper published in New York City. Nuñez was consul at Havre and Liverpool for some time. He was President from 1880 to 1882; was reelected in 1883; and, after the Revolution in 1885 and the reform of the Constitution, was inaugurated for a term of six years in 1886, and again in 1892. He died in office.

NUÑEZ CABEÇA DE VACA, *nũnyáth* *kä-bä'thá dá vä'ká*, **ALVAR** (c.1490-c.1560). A Spanish adventurer in North and South America. He was born in Jerez de la Frontera and was living in Seville when Narvaez was raising his forces for the colonization of Florida. He received an appointment as royal treasurer and high sheriff to the expedition. He shared in all the misfortunes of the undertaking, and was chiefly instrumental in extricating the party from the interior and getting it back to the Gulf coast. In the final wreck of the boats of the Narvaez expedition Nuñez was cast ashore with a few others on one of the islands outside Matagorda Bay, November 6, 1528. The Indians took charge of the survivors, and for some time the Spaniards lived on the islands and adjoining mainland in a state of semi-servitude. Alvar Nuñez secured freedom, and for several years wandered about the country in what is now Texas and Arkansas, trading among the different tribes and acting as physician or medicine man. Eventually, with three others, the only survivors of the Narvaez expedition, Estévan Dorantes, Alonso del Castillo, and a Moorish negro named Estevanico, he started to find the route back to civilization. Making their way from tribe to tribe, across Texas to the Rio Grande, then through Sonora and so on westward, they finally came upon a party of Spanish soldiers in Sinaloa, not far from the Gulf of California. They were sent on to the City of Mexico, where the Viceroy welcomed them on July 24, 1536. Cabeza de Vaca went back to Spain, where he arrived in August, 1537. He claimed some compensation for his years of suffering, asking for the Governorship of Florida. Instead he was granted authority to conquer the territory of the Paraguay Indians along the Rio de la Plata. He expended all his means in equipping an expedition, which sailed in 1540. He soon became involved in difficulties with his subordinates, who eventually put him under arrest and sent him back to Spain. The Council for the Indies after six years sentenced him to banishment in Africa. This sentence was probably not enforced, however, for he is said to have

settled in Seville, where he was living some twenty years later. Cabeza de Vaca's own account of his various adventures, first published in 1542 and 1556, has been translated by Buckingham Smith (New York, 1871) and by Dominguez in the Hakluyt Society volume for 1891.

NUÑEZ DE ARCE, *dä är'thá*, **GASPAR** (1834-1903). A Spanish playwright and lyric poet, born at Valladolid. Before he was twenty he was associated with the editorial staff of the Madrid journal *El Observador*. He soon gained considerable repute by his contributions to the periodical *La Iberia*, as correspondent for which he went through the African campaign (1859-60). He entered the Cortes in 1865, and after the troubles of 1868 he became Civil Governor of Barcelona. In 1882 he became Minister of Colonial Affairs under Sagasta. Nuñez de Arce is of decided merit, both as a dramatist and as a lyric poet, and his verse enjoys widespread popularity in Spanish America as well as in Spain. In 1875 he published a collection of lyrics under the title of *Gritos del combate*, a title indicative of the passion and patriotic energy of most of them. Since it appeared, he has produced other poems of some length, that have likewise won popular favor: the *Idilio*; the *Elegía*, written, like the *Idilio*, in 1878; the *Última lamentación de Lord Byron* (1878); the *Vértigo* (1879, one of the most famed of his works and one which has provoked much imitation, creating a school of his followers in the legend), a graphic description of the crime and remorse of a modern Cain; the *Visión de Fray Martín* (1880), a psychological study of Luther; *La pesca* (1884), a charming idyll; and *Maruja*. As a dramatist, he has written both alone and in collaboration with Antonio Hurtado. His individual works are the comedies, *Deudas de la honra*, *Quien debe paga*, and *Justicia providencial*, in all of which he cultivates the drama of manners, already made successful by Tamayo y Baus and Ayala, and the *Has de leña*, a tragedy both historical and psychological in its tendencies. This last piece deals with the story of Philip II. and his son, Don Carlos. The editions of his lyrics are legion. That of *Gritos del combate* (Madrid, 1891) contains also his prose *Discurso sobre la poesía*. His chief plays are to be found in the *Obras dramáticas escogidas* (Madrid, 1879). Consult also the study of him by Menéndez y Pelayo, in volume ii. of *Novo y Colson's Autores dramáticos contemporáneos*, reprinted in the critic's *Estudios de crítica literaria* (1884).

NUÑEZ DE VILLAVICENCIO, *vil'lä-vé-thän'thé-ö*, **PEDRO** (1635-1700). A Spanish historical, portrait, and genre painter, born in Seville. He first studied under Murillo in Seville, and then, as he was a knight of the Order of Saint John, went to Malta, where he was the pupil of Matteo Preti, called Il Calabrese. Upon his return to Seville, he again studied with Murillo and continued to live with him. He assisted his master in founding the Academy of Seville, and was his testamentary executor. His subjects were similar to those Murillo chose, and the works of the two men sometimes are confused. His "Children Playing with Dice" (in the Prado Museum, Madrid) shows considerable native talent.

NUNIVAK, *nũn'vák*. An island in Bering Sea, situated in latitude 60° N., 50 miles from the mainland of Alaska, and 140 miles southwest

of the mouth of the Yukon (Map: Alaska, B 3). It is 55 miles long, 45 miles wide, and has an area of about 1200 square miles. It is but little known, and inhabited only by Eskimos, who trade in skins and ivory.

NUN OF KENT. See BARTON, ELIZABETH.

NUN'S PRIEST'S TALE. THE. One of Chaucer's *Canterbury Tales*. The source of the tale is a short fable by Marie de France, enlarged later into the old French "Roman de Renart," and a similar story is found in *Aesop's Fables*. Chanticleer, being carried off by a fox, escapes by inducing the latter to open his mouth to berate his pursuers. This slender narrative is amplified by many instances of significant dreams.

NURAGHE, nŭr-ră'gă, or **NURHAG**, nŭr-hăg'. The name of ancient towers, in the shape of truncated cones, three thousand of which in greater or less state of preservation are scattered about the island of Sardinia. They are built of granite, limestone, basalt, porphyry, sandstone, and schist. Some of the stones in the lower courses are of great size; they have been roughly hewn and were laid up without cement. The entrances are small and low and the interiors are divided into two or three stories each with a dome-shaped ceiling. The upper chambers are reached by means of spiral staircases and are lighted through loopholes, and there is supposed to have been a terrace on the summit. They are to be compared with the talyots of Majorca and Minorca, the 'burgs' or 'duns' in the north of Scotland, and in the Shetland Islands; and with the round towers of Ireland, both as to structure and function. Skeletons and deposits made with the dead have been found in them, but their original authors and purpose are not known. Consult: Petit Radel, *Nuraghes* (Paris, 1826-28); Spano, *Nuraghi di Sardegna* (1867); Ferguson, *History of Rude Stone Monuments* (London, 1872); Lambert, *Handbook to the Mediterranean* (ib., 1882).

NUR-ED-DIN EL-BETRUJI, nŭr-ed-dên' el-be-trŭjê. An Arabian astronomer of the twelfth century, born in Morocco, and also known by the name Alpetragius. He is mostly known for his opposition to the epicycle theory of Ptolemy, although he did not substitute anything better. Consult *Alpetragii Arabis Planetarum Theorica Physicis Rationibus Probata* (Venice, 1531).

NUREDDIN-MAHMUD, nŭr-rêd-dên' mâ-môod', **MALEK-AL-ADEL** (1116-74). A Mohammedan ruler of Syria, born at Damascus. His father, Omad-ed-din Zengi, originally Governor of Mosul and Diarbekr on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Homs, Edessa, and Aleppo. Nureddin succeeded him about 1145 and changed the seat of government from Mosul to Aleppo. The feudal Latin States had been established in Syria as a result of the First Crusade, and Count Jocelyn, Prince of Edessa, tried to regain the territories which he had previously lost, but was signally defeated under the walls of Edessa. This was one of the chief occasions of the Second Crusade. Nureddin defeated the Crusaders before Damascus, and finally compelled them to abandon the enterprise. He next conquered Tripolis and Antioch, the prince of the

latter territory being defeated and slain in a bloody conflict near Rugia (June 29, 1149), and before 1151 all the Christian strongholds in Syria were in his possession. An illness, which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and Nureddin, in attempting their resubjection, was totally defeated near the Lake of Gennesaret by Baldwin III., King of Jerusalem; but he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the Caliph of Bagdad to his project to seize Egypt from the effeminate Fatimites and a large army under his lieutenant, Shirkoh, speedily overran Egypt. Shirkoh was succeeded by his nephew, the celebrated Saladin (q.v.), who completed the conquest of the country. Nureddin, becoming jealous of Saladin, was preparing to march into Egypt in person, when he died at Damascus, May 16, 1174.

NUREMBERG, nŭ'rem-bêrg (Ger. *Nürnberg*, nŭrn'bêrk). The second city of Bavaria, Germany, situated on the Pegnitz, about 95 miles north-northwest of Munich (Map: Germany, D 4). It consists of the inner town (still partly walled, and divided by the river into the two parts Sebalderseite and Lorenzenseite, named after its two principal churches) and a number of suburbs where the chief industrial establishments of the city are found. The inner town, with its red-roofed houses and gables facing the street, its numerous churches, and its architectural monuments, is of unusual interest. Nuremberg being the only large city in Germany which has preserved its mediæval appearance to such a remarkable degree. Its fine samples of domestic architecture date mostly from the fifteenth and sixteenth centuries, the period of its fullest political and artistic development, when Dürer, Kraft, Vischer, Stoss, and others made it the centre of German art.

The Church of Saint Lawrence, the finest in the city, was originally built in the thirteenth century, and was restored in the nineteenth century. It is Gothic in style, with beautiful stained glass windows, and has a remarkable stone Ciborium with figures supposed to be those of Adam Kraft and his two pupils. Saint Sebaldus is considered one of the finest Gothic churches of Germany. It was built in the fourteenth and fifteenth centuries and was recently restored. It contains some of the best samples of the work of Nuremberg artists, notably the tomb of Saint Sebaldus by Peter Vischer, the Schreyer Monument by Adam Kraft, and the Last Judgment over the southern entrance, by the same artist. Worthy of mention are also the Marienkirche, with its fine portal, paintings by Wolgemuth, and its curious clock, and the Gothic Church of Saint John.

Among the examples of secular architecture, the Kaiserburg deserves to be considered first, as the nucleus of the city. It was probably founded by Henry II. It was enlarged by Frederick Barbarossa, and is now used in its restored form as a royal residence. It is situated on a rock at the northern end of the old town and contains many objects of art. At the foot of the castle hill stands the town hall, built in Italian Renaissance in 1616-22 and restored in 1884-89. Its chambers are decorated with frescoes and paintings by

Nuremberg artists, and in the court stands a fine fountain dating from the sixteenth century.

Among the numerous old private houses of Nuremberg may be mentioned the Nassauer Haus, a Gothic building of the fourteenth century, the houses of Dürer and Hans Sachs, and the Rupprecht House. The chief modern buildings are the theatre, the law courts, and the chamber of commerce. Many of the squares of Nuremberg are adorned with beautiful fountains and statues, of which the most noteworthy are the Schöne Brunnen, a Gothic pyramid (fourteenth century) covered with numerous statues, the statue of Dürer by Rauch, the fountain in the goose market, the Tugendbrunnen (1589), near the Church of Saint Lawrence, the statue of the poet Konrad Gröbel, and the Kraft stations near Saint John's Cemetery, consisting of a number of pillars adorned with reliefs by Kraft.

The National Germanic Museum, for the purpose of preserving the monuments and promoting the knowledge of German art and culture in prehistoric and historic times, was founded at a congress of German antiquaries in 1852. The plan was approved by the Bavarian and other German governments, and found enthusiastic support among the general public.

In 1857 the museum was definitely located in its present site at Nuremberg, a former Carthusian monastery being purchased to house its collections. The neighboring priory of the Augustines has been recently restored and made a part of the museum, which now forms a picturesque feature in the mediæval quarter of the city. Valuable private art collections, like those of the city of Nuremberg, have been placed in custody of the museum.

The collections are concerned with Germanic antiquities, and are divided into over thirty groups, most of which are accessible to the general public. Among the most important are the collection of Christian and early mediæval antiquities; the gallery of paintings, especially rich in the early German school; the collection of sculptures, including the famous "Nuremberg Madonna," by Peter Vischer the Younger; the cabinet of engravings, containing over 200,000 specimens; collections of stained glass, seals, medals, etc. The museum is especially rich in plaster casts, showing the development of architectural ornament, sculpture, and sepulchral monuments. The library contains over 200,000 volumes; the archives possess a large collection of documents and autographs. The museum has issued many important illustrated publications treating Germanic antiquities, and has a quarterly journal, *Anzeiger des germanischen Nationalmuseums*.

The educational institutions comprise the old gymnasium, whose foundation is ascribed to Melancthon, the new gymnasium, a number of special schools, the valuable library of about 80,000 volumes, the Bavarian Industrial Museum, with valuable collections, and the interesting municipal archives.

The industrial fame of Nuremberg is of long standing. Its wares, comprising chiefly toys, lead pencils, small articles of gold, silver, and ivory, gold leaf, watches, hardware, haberdashery, etc., are still the main products of the city, but there are also extensive machine works, chemical works, manufactures of ultramarine and other paints, railway cars, electrical sup-

plies, lithographs, chromos, etc. The bronze foundry of Professor Lenz is noted for its artistic castings.

The trade of Nuremberg, although of less relative importance than formerly, is still extensive. Besides trading in local manufactures, the city exports large quantities of hops and the small products of the house industry embraced in 'Nuremberg wares,' and it imports groceries, grain, flour, etc. The trade is facilitated by strong financial institutions and good communication facilities.

The municipal affairs are administered by a first and a second burgomaster, a board of magistrates of 27, and a municipal council of 51 members. The municipality owns and operates a gas and an electric plant, the water-works, and an abattoir. The city is equipped with electric railways. Like most large cities in Europe and the United States, Nuremberg has annexed latterly a large number of adjacent communities, with the result that its population has increased from 99,519 in 1880 to 142,590 in 1890, and 261,081 in 1900. The inhabitants are mostly Protestants.

HISTORY. Nuremberg is mentioned for the first time in 1050. Henry III. conferred upon it the privileges of a mint, a market, and a custom-house, and Emperor Lothair granted it to Henry the Proud of Bavaria. Conrad III. annexed it to the Empire and Frederick II. raised it in 1219 to the rank of a free city of the Empire. Its importance increased with its political freedom, and it was the seat of the Diet at which the Golden Bull of Charles IV. was promulgated in 1356. The burgraves of Nuremberg (the counts of Zölre or Zollern since 1191; see HOHEN-ZOLLEHN) interfered but little with the affairs of the city.

Nuremberg became a very important factor in the trade between Italy and Northern Europe, and its material prosperity found expression in that splendor which characterizes its private dwellings so well preserved to our day. In 1427 the city acquired the castle from the burgraves of Nuremberg, who had become margraves of Brandenburg. The foremost centre of German art and one of the wealthiest cities of the Empire, Nuremberg also played a prominent part in the religious struggles in the period after the Reformation, which the city accepted in 1524. It was at Nuremberg that peace was for the first time concluded between Charles V. and the Protestants in 1532, and it was also here that Charles V. entered into a union with the Catholics against the Protestants in 1538. The commercial importance of the city, however, had already been dealt a serious blow by the discovery of the sea route to India in 1497.

The Thirty Years' War, during which Nuremberg was occupied by Gustavus Adolphus, who made vain efforts to dislodge Wallenstein from his intrenched position before the city (1632), and finally the wars of the French Revolution, completely exhausted the resources of the city republic, so that it offered itself to the King of Prussia in 1796 in order to be relieved of its enormous debt—an offer which was declined. The city was annexed to Bavaria in 1806. Nuremberg is noted for the many important inventions credited to its inhabitants, such as the watch, which was originally called the 'Nuremberg egg,' the air gun, the gun-lock, the terrestrial and celestial globes, etc.

NURSE-FROG. A term applied to various frogs which take care of their young or eggs, or both, especially the midwife frog (q.v.). Some curious examples are to be found in the genera *Phyllobates*, *Arthroleptis*, *Rhacophorus*, and among the tree-frogs.

NURSERY (from *nurse*, OF. *norice*, *nourice*, Fr. *nourrice*, nurse, from Lat. *nutria*, nurse, from *nutrire*, to nourish; connected with Goth. *naups*, OHG. *nôt*, Ger. *Not*, AS. *néad*, *nyd*, Eng. *need*, OPruss. *nauti*, necessity). In horticultural parlance, a place where plants are propagated. In the New World the term is usually restricted to those establishments devoting themselves exclusively to the rearing of woody plants, while the rearing of herbaceous plants is classed as a department of floriculture. This division has been the natural result of the enormous demand for plants of both classes, and as one class requires a very different equipment from the other, the tendency toward specialization soon separated the two departments. A further differentiation is being made, a division along the line of fruit-bearing trees and plants and the ornamental or decorative trees and plants.

During the last decade the nursery business has changed in its method most markedly. The nurseryman who grows his own stock, other than peach stock, is the exception rather than the rule. Nearly all the pear and cherry stocks used in America are grown in France; while a great bulk of the apple stocks used in the United States are raised on the deep soils of the prairie by specialists in this line. Since the work of the modern fruit-tree nursery is to produce as large and straight a stock in as short a space of time as possible, and since the prevailing belief is that more than one crop of nursery stock cannot be successfully grown on any given piece of land, new soils are chosen for each crop of nursery stock. A nursery is, therefore, a transient affair, and the plants are usually grown on lands leased for short periods. Since the propagation of forest and ornamental trees seems to be less subject to the objection, viz. impoverishment of soil, urged against fruit trees, most of the nurseries engaged in this work are more permanent in their location. Comparatively few plants of this character are budded and grafted; most of the skill of the propagator is demanded in perpetuating species from seeds and cuttings.

The history of the nursery business began with the colonization of America. As early as 1768 Thomas Young of New York was awarded a prize of £10 for the largest number of apple trees, the number being 27,123. The great nursery interests of the country have from the first been located in western New York. The growth of the enterprise has kept pace with the demands made by the rapidly increasing com-

mercial orchard and vineyard development. Statistics of the census of 1900 show that there were in the United States 4500 nurseries, covering an acreage of over 172,800 acres, representing an investment of \$52,500,000. In these nurseries 45,600 men, 2279 women, and 14,200 animals were employed, and 3,400,000,000 plants were grown. Of these, 518,000,000 were fruit trees, and 685,600,000 grape vines and small fruits. The greatest number of plants of a single species was represented by the apple, of which there were 240,500,000, or more than twice as many trees as were then standing in the orchards of the country.

The influence of the leading nurseries on the horticulture of the country has been very marked. Previous to the development of the experiment stations their office was quite as much to test the merits as to propagate and disseminate a variety. The aim of all leading nurserymen has been to stimulate trade and maintain a high reputation through honest dealing and the dissemination of stock true to name. The sale of spurious stock has worked great injury by retarding development in localities naturally well suited to orcharding. These evils do not exist in developed orchard areas. New fruits introduced from abroad brought with them their natural enemies, the spread of which to other plants has led to the enactment of inspection laws in all States in which either the orchard or nursery business has attained an important place. These laws require the inspection of the orchards and nurseries for certain insect pests and fungous diseases, and prohibit the sale of infested stock, which must be destroyed. If the stock is free from the specified pests the nurseryman is granted a certificate to that effect, and it is taken as a passport in shipping from State to State.

NURSERY LORE. The folklore of children. The material may be separated into two classes, according as it consists of traditional sayings and usages which have been handed down by mothers and nurses, or of customs maintained and transmitted by the children themselves. To the former class belong those nursery rhymes and jingles which are ascribed to Mother Goose, a name adapted from the French. In 1697 Charles Perrault issued a few tales, popular in origin but of literary ornamentation, which he called *Contes de ma mère l'Oye*. This designation was not invented by Perrault, for the goose had long had a popular repute as a story-teller. About 1760 J. Newbery, the first publisher of books for children, produced a little collection of rhymes to which he gave the name of *Mother Goose's Melody*. In 1810 J. Ritson brought out *Gammer Gurton's Garland, or the Nursery Parnassus*, in which he included some rhymes not given by Newbery. Between 1824 and 1827 Munroe and Francis, Boston, Mass., issued an expanded edition under the title of *Mother Goose's Quarto, or Melodies Complete*, reprinted in 1833 as *Mother Goose's Melodies*, and the popularity of this publication may have something to do with the widespread acceptance of the name. Up to this time nursery rhymes were not learned from books, but repeated by word of mouth; it seems likely that the traditional stock was similar to that which has found a place in print.

More curious, from the point of view of folklore, are the games played by children, often to the accompaniment of rhymed formulas. These are for the most part of ancient origin, and although at the present time extinct or moribund, have been traditionally current for centuries. Allowing for minor variations, American game-rhymes are very similar to those of Great Britain, France, and Germany. Such correspondence, formerly interpreted to signify a remote common descent, is now known to be the result of intercommunication. The games, and the formulas used in playing them, were not originally the property of children, but indifferently employed by both old and young. These customs did not owe their origin to peasants; on the contrary, they were introduced and supported by the higher strata of society. Of the games, some have a religious character, or at least were formerly interpreted as possessing religious significance; for example, a sport called 'Weighing,' in which a player is carried by two others, each of whom grasps with right hand the left hand of his fellow, constitutes an imitation of the Last Judgment, in which the soul is to be weighed to determine its destination for heaven or hell. The game of 'London Bridge,' in which the line of participants is made to pass under an arch formed by the lifted hands of two keepers, has been supposed to have had its source in imitation of foundation sacrifices, in which a human being was interred under the bridge in order to insure its stability. A drama enacted by girls, called 'Old Witch,' sets forth the robbery of children by a limping cannibal demon, the devouring of the victims, and their resuscitation by the mother; the witch who figures in this amusement is of the same class as the destroyer of children known to the ancient Greeks as Lamia or Empusa. The well-known childish dance in which is imitated the sowing of oats, etc., may go back to a rite intended to insure the ripening of the crops. Guessing games, in which the object is to win the counters of the adversary, seem analogous to those played in the time of Xenophon, while that in which the opponent is required to guess the number of fingers which may be held up is similar to one depicted on Egyptian pyramids.

NURSERY RHYMES. Children's rhymes, used in the nursery and in childish games. These songs and sayings, witty or absurd, are peculiar to the English language, and for the most part of no great antiquity, the majority scarcely antedating the seventeenth century. It has been thought that some may have had at first a political significance; but many doubtless owed their origin to the infantile love of nonsense for its own sake. Certain rhymes of nurses, such as those used to amuse children in the process of dressing, may have a more respectable antiquity.

A word may be added about the formulas known as 'counting-out rhymes' in games. One word is told off for each player, and he on whom falls the final syllable is dropped from the row; this process of exclusion is continued until only one remains, who is 'it.' All modern nations possess similar rhymes, which have the common property of being unintelligible. It has been supposed that the rhymes were invented for purposes of sorcery or sacrifice, and have become degraded in their survival; yet it is uncertain whether we are to look for any deeper motive than a childish fondness for mystery and nonsense.

NURSES, TRAINING OF. At the end of the fourth century, when the temples of Æsculapius, Hygeia, and Serapis were closed, the sick poor formerly housed in these temples were turned adrift. Christian monasteries and temples were opened to them, and conventual orders arose whose office was to provide for the sick. In very early times there was a corporation of matrons and elderly women in England who were employed in obstetrics, at that time forbidden to men. The eleventh century saw the beginning of the founding of hospitals, many of which were rendered necessary by the Crusades. The hospitalers were assisted by various bodies of women, in the dearth of physicians. In the latter part of the twelfth century Hildegard, Abbess of Rupertsberg, organized a school of nurses for service in the hospitals. From these beginnings grew the modern system of training nurses for charitable hospital work, for charitable work among the sick poor in their homes, and later for assistance to the sick rich for proper remuneration. In 1840 'Mrs. Fry's nursing sisters' composed an organization which cared for the outcasts of London society. Florence Nightingale (q.v.) gave the greatest impetus to the movement toward securing efficient training for nurses, after her return to London in 1853, upon the completion of an inspection of hospitals all over Europe. In 1872 the Bellevue Training School, New York City, sent out the first class of trained nurses graduated in this country.

The course of study for nurses under training has become lengthened during the past ten years. In some small towns in the United States the course at a local hospital may be completed in a year, in others in eighteen months. In New York and Philadelphia the course extends in a few schools over two years' time; in most over three years' time. An applicant is received into the school for a period of two months on probation. During this period applicants receive their board and lodging at the training school without charge, and serve without remuneration, and their education, physical strength, endurance, adaptability, powers of observation, and judgment are tested. Should they prove acceptable, they are required to sign an agreement for the remainder of the term of three (or two) years, to obey regulations, and to remain in the school till the term has ended. Pupils reside in the hospital or in the training-school building, and assist in various departments. They wear a uniform when on duty. No charge is made for instruction. The pupils receive board, lodging, and laundering of clothing, and a certain amount of money for the purchase of text books and uniforms, and for incidental expenses. The instruction is given by the physi-

cians and surgeons of the visiting and resident staffs of the hospital, the superintendent, and the head nurses, and covers anatomy and physiology, and all departments of nursing, including cooking of proper food and delicacies, and frequently massage, obstetrics, and the care of insane as well as alcoholic patients. In some institutions there is a regulation under which nurses are sent out to nurse in families before completing their course of study as a test of fitness.

Perhaps the most prominent training schools in the United States are the following: Bellevue, Presbyterian Hospital, New York Hospital, and Mount Sinai Hospital, in New York City; Massachusetts General Hospital, in Boston, Mass.; Philadelphia Hospital and Pennsylvania Hospital, in Philadelphia, Pa.; Johns Hopkins Hospital, in Baltimore, Md.; and Illinois Training School, Chicago, Ill. Consult: Nightingale, *Notes on Nursing* (London, 1860); Mitchell, *Nurse and Patient* (Philadelphia, 1877); Hampton, *Nursing* (Philadelphia, 1893).

NURSE-SHARK. (1) A shark (*Ginglymostoma cirratum*), the type of a family, which abounds in the waters of the West Indies and on the west coast of Mexico, where it is called 'gata.' It is from six to ten feet in length, and is brownish in color, with an obtuse depressed head and rounded fins. See Plate of GREAT SHARKS. (2) In New England, the sleeper (*Somnolus microcephalus*). See SLEEPER-SHARK. (3) The Port Jackson shark. See CESTRACIONT.

NUS, nus, EUGÈNE (1816-94). A French dramatist, born at Chalon-sur-Saône. His first dramatic success was *Jacques le corsaire* (1844), and his other plays include: *L'enseignement mutuel* (with Desnoyer, 1846); *Le vicair de Wakefield* (with Tisserand, 1849); and *La tour de Londres* (with Brot and Lemaitre, 1855). He was also prominent as a Socialist, and was at the head of the *Bulletin du Mouvement Social* in 1873. His writings include: *Les dogmes nouveaux* (1861), poems; *La république naturaliste. Lettre à Emile Zola* (1879); *Choses de l'autre monde* (1880); *A la recherche des destinées* (1891); and *Vivisection du catholicisme* (1894).

NUSKU, nōōs'kōō. A Babylonian and Assyrian deity. Originally a solar deity (according to some, a lunar god), he became a fire-god. His name is not found in historical inscriptions until the Assyrian period, which may be accounted for by his general identification with another and perhaps older fire-god, Gibil. He was regarded as the messenger of the gods, fire being the medium of intercourse with deity (cf. Agni in the Indian theology), but in this aspect he was inferior to the far better known Nabu. Nusku, along with Gibil, appears especially in the incantation texts, where, according to universal arts of witchcraft, fire is used to destroy symbolic representations of an enemy, and so is supposed to affect the latter's person. In this connection Nusku had a wide vogue in the vulgar religion. As the god of fire he was also honored as a patron deity of civilization. Consult Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898).

NUSLE, nōōs'lyē. A town in the Crownland of Bohemia, Austria, situated a few miles south-east of Prague, in a wine-growing region. The

town has a castle and a park. Population, including the adjacent village of Pankratz, in 1890, 11,740; in 1900, 20,440.

NUSSBAUM, nus'boum, JOHANN NEPOMUK (1829-90). A German surgeon, born in Munich. He became lecturer in surgery and ophthalmology at the University of Munich in 1857, and in 1860 received a professorship. He retired in 1890. As both surgeon and writer on surgical topics he became well known in Germany. His publications include: *Die Pathologie und Therapie der Ankylosen* (1862); *Vier chirurgische Briefe an seine in den Krieg ziehenden ehemaligen Schüler* (1866); *Die Verletzungen des Unterleibs* (1880); and *Ueber Chloroformwirkung* (1885).

NUT (AS. *knuhtu*, Icel. *hnót*, OHG. *nuz*, Ger. *Nuss*, nut). A hard, one-seeded, indehiscent (non-opening) fruit, which has usually come from an ovary of several carpels, as the acorn, hazelnut, etc. (See FRUIT.) The best-known and most valuable nuts are almonds, Persian or English walnuts, cocoanuts, pecans, Brazil nuts, hazelnuts, chestnuts, and the various hickory nuts, butternuts, etc., all of which are edible and of commercial importance. Strictly speaking, the peanut is not a nut, although commonly spoken of as such. The various nuts are considered under their separate headings.

In 1899 the United States imported 9,957,427 pounds of almonds, having a value of \$1,222,587. The value of the cocoanuts imported amounted to \$625,789, and of all other nuts, \$879,166. The exports of domestic nuts the same year amounted to \$140,250. The most important nuts now grown commercially in the United States are the Persian or English walnuts, almonds, pecans, and chestnuts. The culture of the first two is confined almost entirely to California. The Persian walnut crop amounts to about a million pounds a year, and the almond crop to between 600,000 and 800,000 pounds. Pecan orchards are largely confined to the Southern and Southwestern States and California, but the bulk of the crop is obtained from native trees in Louisiana and Texas. Commercial chestnut orchards are few in number in the United States, but they are increasing from year to year, European and Japanese varieties being largely used to top graft the small native sweet varieties. As with pecans, the bulk of the crop is produced on wild trees. Other native nuts of the United States, which have a greater local than commercial value, are black walnuts, butternuts, the various shellbark hickory nuts, hazelnuts, and chinquapin.

FOOD VALUE. From 50 to 65 per cent. of the nuts most commonly eaten (almonds, Brazil nuts, filberts, hickory nuts, pecans, and walnuts) consist of shell. All of these nuts contain little water. The percentage of protein is fairly high, but fat constitutes the largest part of the edible portion, and carbohydrates, which are usually important constituents in vegetable foods, are generally present in small amounts. The chestnut, however, contains nearly 40 per cent. carbohydrates. The percentage in cocoanuts, acorns, and litchi nuts is also fairly high. The meat of nuts, excepting those last mentioned, contains nearly fifty times as much fat and less than one-fifth as much carbohydrates as wheat flour, and has about double the fuel value, i.e. energy-producing power. A pound of unshelled nuts will furnish about half

as much protein and the same amount of energy as a pound of flour. Owing to their high fuel value and low protein content, nuts would not make a well-balanced food when eaten by themselves. This is no reason, however, why nuts should not fill an increasingly large place in dietaries. Very few foods supply the needed nutrients in the proper proportion to form a well-balanced ration. Foods rich in fuel constituents need to be combined with other foods of relatively high protein content.

The composition of a number of different kinds of nuts used as food is shown in the following table:

COMPOSITION OF NUTS

	Refuse	Edible portion	Composition and fuel value of the edible portion						
			Water	Protein	Fat	Carbohy- drates	Ash	Fuel value, per pound	
	Per ct.	Per ct.	Per ct.	Per ct.	Per ct.	Per ct.	Per ct.	Calories

There is little reliable information regarding the digestibility of nuts. The belief that they are indigestible, i.e. digest with difficulty, causing more or less pain or distress, seems to be widespread, and perhaps has some basis in fact. It is quite probable that if the nuts were properly prepared and eaten at proper times much of this prejudice would disappear. There is also a general belief that salt eaten with them aids in their digestion. The present practice of munching them at odd hours, or as a dessert, when sufficient food has been taken to meet the requirements of the body, overtaxes the digestive organs and places the nut under a reproach that is, at least in part, undeserved. While most nut meats are generally eaten without any previous preparation, they may be used in a variety of ways. Chopped nut meats are much relished for sandwiches, and nut salads are not uncommon, while nuts, most commonly chestnuts, are often used as stuffing for roast fowl. The use of nuts in cakes, confectionery, creams, etc., is common. Large quantities of pecans are used by confectioners for making salted pecans, and bonbons of various sorts; and in some European countries, where the chestnut is abundant, bread is made from the ground kernels. Many attempts have been made to prepare nut foods, and to extend their use in various ways. An oil used for salad and other culinary purposes is expressed from beechnuts, walnuts, and very likely from others. Cocconut oil is much used for culinary purposes, especially in the tropics. This and other nut oils also have various commercial uses.

(Washington, 1896); Fuller, *Nut Culturist* (New York, 1896); Parry, *Nuts for Profit* (Parryville, N. J., 1897); Maine Agricultural Experiment Station, Bulletin 54, *Nuts as Food* (Orono, Maine, 1899).

NŪT, nŏt. An Egyptian goddess, the wife of Seb (q.v.), or, according to other accounts, of the sun-god Rē. She personified the sky, and is usually represented as a naked woman bending, with feet and hands touching the ground, over Seb (the earth), who lies prostrate beneath her. Nūt is also depicted as a cow uplifted by the god Shu and supported by other divinities, while over

her body, which is adorned with stars, travels the bark of the sun. In the legend, the sun-god Rē, weary of ruling over the earth, retires to rest upon the back of the celestial cow, which typifies the goddess Nūt. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Lepsius, *Ueber die Götter der vier Elemente* (Berlin, 1856); Brugsch, *Religion und Mythologie* (Leipzig, 1888-90).

NUTATION (Lat. *nutatio*, a nodding, from *nutare*, to nod). A vibratory motion of the pole of the equator due to the unequal attraction of the moon on the equatorial ring of the earth. Astronomers define the positions of the stars on the celestial sphere by means of their right ascensions and declinations (q.v.), which are analogous, respectively, to longitudes and latitudes on the earth. But one of the effects of gravitational attraction is to change the position on the sky of the celestial equator, thus altering continually the right ascensions and declinations of all stars. This alteration is called *precession* (q.v.). The general effect of precession is to cause the celestial pole to describe a circle around the pole of the ecliptic (q.v.) once in about 25,800 years. This rotation, however, is not quite uniform. It is subject to a small disturbance of about nine seconds of arc, called *nutations*. This nutation acts forward and backward about 1400 times in the course of one 25,800-year rotation of the celestial pole. The stars' right ascensions and declinations are therefore alternately increased and decreased by nutation, whereas precession generally acts in one direction over a great number of years.

NUTATION (in Plants). The bending movements executed by organs of plants, such as stems, leaves, roots, etc., by which the part is inclined successively in various directions. Nutations are due to the unequal rate of growth of different sides of the organ, an inequality which, as far as is known at present, is dependent upon internal (unknown) causes, and is not called forth by the action of external stimuli. See IRRITABILITY.

Simple nutation occurs in dorsiventral organs, such as flat leaves, both foliage and floral. The movements are only in one plane, being dependent upon the unequal growth of the opposite sides. When young the growth of the foliage leaves is most rapid upon their outer (dorsal) face, in consequence of which the leaf applies itself to the axis, arches over the apex, and with its neighbors forms a compact bud. Later, growth becomes more rapid on the inner (ventral) face, the bud opens, and the leaves straighten out. Similar inequality of growth, but more sharply localized, leads to the folding and rolling of the leaf in the bud. (See *Vernation*, under *BUD*.) Like movements of radial organs, such

NUTATION OF THE TIP OF THE PEA-STEM.

The dots represent the observations; the line is drawn merely to show their serial relation. The true path is doubtless less angular.

as stems, cylindrical leaves, and roots, have been termed circumnutation or revolving nutation, to distinguish them from the simple nutation of dorsiventral organs. When any plant is in vigorous growth the axis rarely grows in length uniformly on all sides. The side on which growth is most rapid will push the apex over toward the side on which growth is less rapid. If the region of more rapid growth changes, shifting around the axis, the tip will be inclined successively to all points of the compass, and with its simultaneous upward growth will describe a spiral; but since the rate of growth is not uniform at successive intervals, the path described will be a very irregular spiral. A path of this kind, reduced to a plane, is shown in the accompanying figure.

Movements quite similar to those above described are called forth in plant organs as re-

sponses to external stimuli. Thus twining plants exhibit both true nutation and nutation due to a geotropic sensitiveness. (See *GEOTROPISM IN PLANTS*.) Changes in temperature cause flowers to open or close by movements which resemble the simple nutation of dorsiventral organs. Thus the tulip, crocus, and other vernal flowers are very sensitive to changes in temperature. The latter can perceive a change of 0.5° C., and will respond to a change of 20° C. in two minutes.

NUT-BROWN MAID, THE. An English ballad of the fifteenth century, telling the exceptional story of the maid, a high-born lady, who maintains her love and constancy to her outlaw lover through the tests he uses to try her. Finally she conquers, and finds the outlaw is also of high degree, and his banishment is feigned. The lover has been supposed to be the Earl of Cumberland, and the nut-brown maid, Margaret Percy. The earliest version is found in Arnold's "Chronicle," a collection of London antiquities (1502). It was reprinted in 1707 in the "Muses' Mercury," and paraphrased by Prior in his "Henry and Emma," in 1718.

NUT-CRACKER. A bird of the crow family, of the genera *Nucifraga* and *Picicorvus*. The form and characters are similar to those of crows, but the habits are rather those of jays, and in some respects indicate an approach to woodpeckers. One species (*Nucifraga caryocatactes*) is not uncommon in Europe and Asia, particularly in mountainous regions covered with pines. It is about the size of a jay, but has a longer tail. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The nut-cracker frequents the tops of high pines, is shy, and breeds earlier than most birds, and in a very secretive manner. Its food, apart from some insects in summer, consists of the seeds extracted from pine cones. These it holds with its feet while it works at them; but its ability to crack a nut, in spite of its name, is doubtful. The only American nut-cracker (*Picicorvus columbianus*), usually called 'Clarke's crow,' inhabits the pine regions of the West from Mexico to Alaska, and is gray with black and white wings and tail. It is noisy and gregarious, but during the breeding season it is shy. It builds its nest in the tops of tall pines and conceals it with care. The eggs are light grayish green, marked with grayish brown and lilac. Consult: Newton, *Dictionary of Birds* (London, 1893-96); Coates, *Birds of the Northwest* (Washington, 1874); Keyser, *Birds of the Rockies* (New York, 1902). See Plate of JAYS, MAGPIES, ETC.; and Colored Plate of EGGS OF SONG BIRDS.

NUTGALL, or GALL. See GALL-INSECTS.

NUT GRASS. See CHUFA, and Plate of CY-PRESS, ETC.

NUTHATCH (formerly also *nuthack*, ME. *nuthake*, *nuttehake*, from *nut* + *hack*). A genus of birds of the family Paridae, having a straight bill and short legs, the hind toe very strong. The genus is represented in North America by four species, of which the white-bellied nuthatch (*Sitta Carolinensis*) is the commonest and best known. It is found throughout the whole United States and Canada, and is about six inches long, clear ashy blue above, white beneath, and with the crown rich, glossy, green-black. It is abundant in most localities in the fall and spring and

often during the winter, when its thrice-repeated querulous call, *nee-nee-nee*, is constantly heard; but in summer it is rather retiring. The nest is made in holes in trees, and the eggs, six to eight in number, are white, speckled with reddish and lilac. The other American species are the smaller red-breasted nuthatch (*Sitta Canadensis*), the brown-headed nuthatch (*Sitta pusilla*) found in the South Atlantic and Gulf States, and the pygmy nuthatch (*Sitta pygmaea*), found from the Rocky Mountains to the Pacific. The last two species are only four inches long. The red-breasted nuthatch is found throughout temperate North America, but is not nearly so common as its white-breasted brother. The European nuthatch (*Sitta Europaea*) is common in most parts of Europe. If taken young, it is easily tamed, and becomes very familiar and amusing. Several other species are known in Asia and Africa.

NUTMEG (ME. *nutmegge*, *nutmege*, from *nut* + *muge*, OF. *muge*, musk, from Lat. *mucus*, musk). The kernel of the fruit of several species of Myristica, of the natural order Myristicaceæ, which contains about eighty species, all tropical trees or shrubs, natives of Asia, Madagascar, and America. The fruit is succulent. It opens like a capsule by two valves. The seed is nut-like, covered with a laciniated fleshy aril which appears in commerce as mace. The species which furnish the greater part of the nutmegs of commerce is *Myristica fragrans*, or *moschata*, a tree about 25 feet in height, with oblong leaves, and axillary, few-flowered racemes; the fruit, which is golden yellow when ripe, resembles a pear in size and appearance. The fleshy part of the fruit, which is rather hard, is of a peculiar consistence, resembling candied fruit, and it is often preserved and eaten as a sweetmeat. Nutmegs are now successfully cultivated in the East Indies, Spice Islands, West Indies, and Brazil. Nutmegs are chiefly used as a spice. They yield, by expression, a peculiar yellow fat, called oil of mace (because of its color and flavor, it was generally supposed to be derived from mace), and by distillation is obtained an almost colorless essential oil which has very fully the flavor of the nutmeg. In 1890 the United States imported nutmegs to the value of \$534,340.

Other species of *Myristica* yield nutmegs which, though sometimes used, are of inferior quality. The fruits of several species of Lauraceæ also resemble nutmegs in their aromatic and other properties, as the cotyledons of *Nectandra puchury-major* and *puchury-minor*, the *Pichurim* beans of commerce, and the fruit of *Acrodictidium Camara*, a tree of Guiana, the *camara* or *ackawai* nutmeg. The clove nutmegs of Madagascar are the fruit or *Ravensara aromaticum*, and the Brazilian nutmegs of *Cryptocarya moschata*. The calabash nutmeg is the fruit of *Mondora Myristica*, of the natural order Anonacæ. See Colored Plate of FLAVORING PLANTS.

NUTMEG-BIRD. A bird-dealer's name for one of the mynas (*Munia punctulata*), also known as the 'cowry-bird.' An East Indian fruit-(nutmeg-)eating pigeon of the genus *Myristicivora* is known as the 'nutmeg pigeon.'

NUTMEG FLOWER. See NIGELLA.

NUTMEG STATE. Connecticut. See STATES, POPULAR NAMES OF.

NUTRIA. The local Spanish name in South America for the coypu (q.v.), also called 'ra-coonda,' and the trade name for its fur.

NUTRITION (from Lat. *nutrire*, to nourish). The process by which living organisms appropriate, modify and utilize the materials needful for their existence, growth, and development. The ultimate appropriation of food takes place in the individual cell, which seems to have a gland-like power not only of attracting materials from the blood, but of causing them to assume its structure and participate in its properties. A necessary complement to the process of assimilation is that of excretion, which consists in the discarding of effete matter—the products of its own vital activity—by the cell. In modern terminology the assimilative or building up process is called anabolism; the disassimilative or breaking down process is called katabolism, and the sum of the two, metabolism. The blood is the medium through which nutritive materials are brought to the cells and excreted products are carried off. It is borne by the capillaries to the several tissues of the body and is the source from which they derive the materials for their growth and development; and there is a direct relation between the vascularity of any part and the activity of the nutritive operations which take place in it. Thus in muscle, skin, and mucous membrane, and in nerve tissue, rapid decay and renovation are constantly going on, and in these tissues the capillaries are most abundant; while in cartilage and bone, tendon and ligament, disintegration is comparatively slow, and the capillaries fewer.

All the processes of development and growth are the results of the plastic or assimilative force by which living bodies are able to form themselves from dissimilar materials (as when an animal subsists on vegetables, or when a plant grows by appropriating the elements of water, carbonic acid, and ammonia); but they are the results of this force acting under different conditions.

Development is the process by which each tissue or organ of a living body is first formed, or by which one, being already incompletely formed, is so changed in shape and composition as to be fitted for a function of a higher kind, or finally is advanced to the state in which it exists in the most perfect condition of the species.

Growth, which commonly concurs with development, and continues after it, is properly mere increase of a part by the insertion or super-addition of materials similar to those of which it already consists.

Nutrition, on the other hand, is the process by which the various parts are maintained in the same general conditions of form, size, and composition.

In the elementary forms of animal and vegetable life, represented on the one hand by the amœba and on the other by bacteria, the process of nutrition is a comparatively simple one. They are surrounded by a material which they can use as food, and each individual cell, being fitted to digest and absorb, appropriates what it needs and rejects what it does not require. In the higher animals, however, careful selection and a high degree of preparation and modification of the food is necessary; and these processes are carried

on in the digestive canal and by the secretions of the glands (q.v.) which open into it. The phenomena attending the elaboration of food and its preparation for assimilation by the tissues are described under **DIGESTION, ORGANS OF**.

In order that nutrition may be carried on in a healthy manner, certain conditions must be present. The blood must be normal in composition and amount, and circulate with suitable rapidity; there must exist a certain nervous stimulation and control; and the part to be nourished must be able to appropriate the materials brought to it by the blood. The dependence of nutrition upon the first of these conditions is shown in anæmia, in which disease the contents and carrying capacity of the blood are lowered, and nutrition correspondingly depressed. The influence of the nervous system is demonstrated by the atrophy or even death of a part which follows the destruction or cutting off of its nerve supply. This often happens in certain diseases of the spinal cord.

It is not only necessary that the body should be supplied with food in order that its natural functions may be performed, but it is equally necessary that the food supplied should consist of the proper materials. Each animal by instinct seeks those substances which best meet the needs of its own metabolism, and it is a matter of every-day experience that man endeavors to supply himself with food suitable to the conditions under which he lives, and alters his diet with respect to season, latitude, age, activity, and occupation. Food is intended to supply the place of that which is given out by the body. But in the choice of diet this is not enough; the food should be sufficient to meet such needs without waste, and without increasing unduly the output of excreta, while the organism should be maintained in health. Careful analysis of the excreta shows that they are made up, besides water, chiefly of the chemical elements, carbon, hydrogen, oxygen, and nitrogen, but that they also contain, although in smaller amounts, sulphur, chlorine, potassium, and certain other elements. To balance this waste it is evident that food must be supplied containing all these elements in something like the proportion in which they are excreted; that is, a 'mixed diet' is necessary. Experiments upon the lower animals have shown that a diet composed exclusively of one class of food, such as fat, or sugar, results in the death of the animal after a longer or shorter period of time. See **DIET**.

The subject of nutrition is exhaustless. It comprehends all vital phenomena, for none of the functions of life are performed without involving replacement by living matter, and therefore nutrition. The subject of hygiene in all its aspects is connected with it, whether in eating, drinking, exercise, sleeping, or breathing. A change in each of these processes involves a corresponding change in the elaboration and appropriation of new material, and the dissimulation or elimination of old, or its reconversion.

Consult the chapters on "Nutrition and Diet," in Kirke, *Handbook of Physiology* (Philadelphia, 1902); and Foster, *Textbook of Physiology* (New York, 1900). See **RESPIRATION; SECRETION**.

NUTRITION (in Plants). In its widest sense the nutrition of plants includes all processes by which food is obtained and used. The

food of plants consists of organic material. Even the green plants require organic food, which they manufacture out of the simpler substances, carbon dioxide and water, that they absorb. The mode in which plants obtain both foods and the materials out of which foods can be made, is described under the head of **ABSORPTION**. (For the nature of the materials which plants require, see **FOOD OF PLANTS**.) Reserve foods are stored in the special tissues or organs. Such materials must be moved first from regions of absorption or manufacture to the points of storage, and after digestion at some later time thence to the regions of growth. Having been brought to the regions of growth, some of the food is used for the supply of energy to the protoplasm, either directly or after incorporation into the substance of the protoplasm itself. The energy is released through the process of oxidation and the by-products are carried away. All processes of nutrition connected with the release of energy for growth and movement constitute the function called respiration (q.v.). Other portions of the food are utilized for the making of new parts. See **GROWTH; PHOTOSYNTHESIS; ASSIMILATION; STORAGE; DIGESTION**.

NUTT, nüt, ALFRED TRUBNER (1856—). An English folk-lorist, born in London, and educated at the University College School and the Collège de Vitry, France. He studied the publishing business in Leipzig, Berlin, and Paris from 1874 until 1877, and then succeeded to that of his father in London. He was one of the original members of the Folk-Lore Society, became its president in 1897, and was a founder of the Irish Texts Society in 1898. His publications are: *The Legend of the Holy Grail, with Especial Reference to the Hypothesis of the Celtic Origin* (1888) and *The Voyage of Bran* (2 vols., 1895-97).

NUTTALL, THOMAS (1786-1859). An American ornithologist and botanist, born at Long Preston, Settle, England. He came to the United States in 1808, and went West. Though an ardent ornithologist, and constantly in the wilderness, he rarely carried a gun. In 1822 he was made professor of natural history at Harvard University, but gave only irregular instruction, devoting himself mainly to the culture of the botanic garden, founded in 1805 by his predecessor, Dr. W. D. Peck. He remained in Cambridge ten years, and wrote and published *The Genera of North American Plants* (1818) and *A Manual of the Ornithology of the United States and Canada* (1832-34), in two volumes, which is a classic in American science. A second enlarged edition was published by Nuttall in 1840; and a third edition, with notations by M. Chamberlain, was published in Boston in 1896. In 1834 Nuttall suddenly resigned his professorship and started on an expedition to the Pacific Coast, led by Captain Wyeth, and accompanied by another naturalist, J. K. Townsend, who published a *Narrative of the journey* (1839). From California he went on to the Sandwich Islands, whence he returned around Cape Horn, in the vessel which had among its crew Richard H. Dana, author of *Two Years Before the Mast*. Nuttall then settled in Philadelphia and prosecuted scientific study and writings for a few years. After publishing a second edition of his *Ornithology* (1840), and a *Supplement to Mi-*

chaux's *North American Sylva* (1842-49), he returned to inherited estates in Lancashire, where he died.

NUT-WEEVIL. Any one of several species of weevils, of the family Curculionidæ, which infest chestnuts, hickory nuts, and other nuts. They belong to the genus *Balaninus*, and are of rather large size, usually clay-yellow in color, and possess an exceedingly long, slender beak or snout. By means of this beak they puncture the burs of young chestnuts, the husks of hickory nuts and walnuts, and the coverings of young acorns, reaching nearly to the centre of the nut, and placing an egg in the hole thus made. The larva, which is a stout white grub, eats out the interior of the nut and burrows its way through the shell, and then enters the ground to pupate.

NUX VOMICA (Neo-Lat., vomit nut, from Lat. *nux*, nut, and Neo-Lat. *vomicus*, relating to vomit, from Lat. *vomere*, to vomit). The pharmacopœial name of the seed of *Strychnos nux vomica*, or *poison nut*. The seeds, which are imported from the East Indies, are nearly circular and flat, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray color, thickly covered with short satiny hairs, internally translucent, tough, and horny, intensely bitter, and inodorous.

The *nux vomica* tree is a native of Coromandel, Ceylon, and other parts of the East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbs. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp. The bark is sometimes known as *false Angostura bark*, having been confounded with *Angostura bark* in consequence of a commercial fraud; but its properties are very different, as it is very poisonous.

The seeds contain (in addition to inert matters, such as gum, starch, woody fibre, etc.) two alkaloids closely related to each other, which act as powerful poisons on the animal frame, and speedily occasion violent tetanic convulsions and death. These alkaloids or bases are named *strychnine* and *brucine* (q.v.).

Nux vomica is poisonous in a greater or lesser degree to most animals. In very small doses, its effects upon man are those of a general tonic, acting as a stimulant to digestion, circulation, respiration, and the nervous system. It seems to exert a selective action upon the cells of the anterior bone of the spinal cord. In larger doses there is a disordered state of the muscular system; the limbs tremble; a slight rigidity or stiffness is felt when an attempt is made to put the muscles in action; respiration is jerky and there is a sense of uneasiness. If the use of the medicine is continued these effects increase in intensity, and the voluntary muscles are thrown into a convulsed state by very slight causes—as, for example, by inspiring more deeply than usual, or even by turning in bed. In paralysis the effects are most marked in the paralyzed parts. In poisonous doses the symptoms are like those of tetanus, but with the muscles of the jaw the last to be affected, followed by death. It is difficult to say what is the smallest dose that would prove fatal to an adult. Thirty grains of the powdered nuts, given by mistake to a patient, destroyed life. Three

grains of the extract have proved fatal, half a grain of sulphate of strychnine caused death in fourteen minutes. Its chemical antidote is tannin, which forms a partially insoluble compound.

NYACK, n'ák. A village in Rockland County, N. Y., picturesquely situated on the west bank of the Hudson River, at the broad expansion called Tappan Bay, opposite Tarrytown, with which it is connected by ferry, and 27 miles north of New York City; the terminus of the Northern Railroad of New Jersey, a branch of the Erie Railroad (Map: New York, G 4). It is popular as a place of residence and as a summer resort. It has a public library, and is the seat of the Hudson River Military Academy, Rockland Military Academy, and Nyack Military Academy. There are cloth-finishing and yacht and boat building establishments, also manufactories of shoes, carriages, sleighs, etc. Nyack was settled about 1700, was incorporated as a village in 1873, relinquished its charter in 1876, and was reincorporated in 1883. The government, under a general village law, revised in 1897, is vested in a president and board of trustees. The water-works are owned and operated by the village. Population, in 1890, 4111; in 1900, 4275.

NYAM-NYAM. An African people. See NIAM NIAM.

NYAN. The name in Ladak for an argali (q.v.).

NYANGWE, nyäng'wë. A trading station on the Upper Congo, in Congo Free State, Central Africa, in longitude 26° 20' E., and latitude 4° 15' S. (Map: Congo Free State, E 3). It is connected by a caravan route with Lusambo, on the Sankuru, from where there is steam communication with Leopoldville. It is also connected with Albertville, on Lake Tanganyika. Nyangwe was visited by Livingstone in 1871, and was the starting point for Stanley's expedition to the mouth of the Congo in 1876.

NYANZA, nyān'zá. A word in the eastern Bantu languages meaning 'great water,' and applied to several of the large lakes in Central Africa. See ALBERT EDWARD NYANZA; ALBERT NYANZA; NYASSA; VICTORIA NYANZA.

NYASSA, nyās'sá (a form of the Bantu word *nyanza*, meaning 'great water'). One of the large lakes of Southeastern Africa. It is situated southeast of Lake Tanganyika, and about 380 miles from the Indian Ocean, between latitudes 9° 30' and 14° 25' S. (Map: Congo Free State, F 5). It is 340 miles long from north to south, with an average breadth of 40 miles, and an area of 14,200 square miles. Near its southern and eastern shores it reaches a depth of 700 feet, and in many places its bottom lies below the surface of the Indian Ocean, but it becomes shallow toward the north and west. It closely resembles Lake Tanganyika (q.v.) in shape and formation, both being formed by deep fissures in the great plateau. Lake Nyassa is surrounded on all sides by mountains, which on the east coast are from 5000 to 10,000 feet high. Between these and the shores there is an intervening strip of low, sandy or marshy alluvial land from 2 to 10 miles wide, except in the northeast, where the mountains approach close to the water's edge. On the west the mountains are broken in several places by gaps through which rivers find their way to the lake, which is drained southward into

the Zambezi through the Shire River. Anchorage can be found in some of the creeks and river mouths, and several British and German steamers ply regularly on the lake, which is bounded on the west by British Central Africa, and on the northeast by German East Africa. Lake Nyassa was discovered by Livingstone in 1859.

NYASSALAND, *nyās'sā-lānd*. Formerly the name of the British Central Africa Protectorate (q.v.).

NYĀYA, *nyā'yā* (Skt., analysis). The name of the sixth and latest of the orthodox systems of ancient Hindu philosophy.

Of the six systems the Mimamsa and Vedānta are grouped together as more closely connected in dealing with divine and spiritual matters. The Nyaya and Vaiseshika systems form a group, having in common especially the atomic theory of the universe, and a clear and logical classification of ideas. The latter feature is particularly characteristic of the Nyaya system, so that it is commonly spoken of as 'Logic,' although it is really a philosophical system. The Nyaya agrees with all the other systems in promising to its followers final beatitude. The way to the attainment of supreme bliss is through a knowledge of the principles taught by this particular system. These principles are embodied in the sixteen 'topics,' *pramāṇa*, or means of knowledge, *pramēya*, or objects of inquiry, *samśaya*, or doubt, *prayōjana*, or purpose, *dṛṣṭānta*, or precedent, *middhānta*, or tenet, *avayava*, or syllogistic member, *tarka*, or confutation, *nirṇaya*, or ascertainment, *vāda*, or discussion, *jalpa*, or wrangling, *vitāṇḍa*, or caviling, *hetvābhāsa*, or fallacy, *chala*, or prevarication, *jāti*, or futile objections, and *nigrahasthāna*, or failure in argument.

The great prominence given by the Nyaya to the method by means of which truth might be ascertained has sometimes misled European writers into the belief that it is merely a system of formal logic, not engaged in metaphysical investigations. It was, however, really intended to be a complete system of philosophical investigation; and some questions, such as the nature of intellect and articulated sound, or those of genus, variety, and individual, it has treated in a masterly manner:

The founder of the Nyaya system is said to have been Gotama, or Gautama. The events of his life and his date are quite unknown, though it is probable that the work attributed to him is, in its present shape, later than the work of the grammarian Panini (q.v.). It consists of five books, or *Adhyāyas*, each divided into two 'days' or diurnal lessons, which are again subdivided into sections or topics, each of which contains several aphorisms, or *Sūtras*. Like the text-books of other sciences among the Hindus, it has been explained by commentaries, which, in their turn, have been made the bases of more popular or elementary treatises.

The Nyaya system, like the kindred Vaiseshika, was originally atheistic. It became theistic later, but without acknowledging the existence of a personal God as a creator of matter. This feature, which it shares with the later form of the Vaiseshika, was elaborated in Udayanacharya's *Kusumāñjali* (about A.D. 1200), and in some other works.

The Sanskrit text of the Sūtras of Gotama, with a commentary by Visvanatha, was edited at

Calcutta (1828), and the first four books, and part of the fifth, of the text, with an English version, an English commentary, and extracts from the commentary by Ballantyne (Allahabad, 1850-54). More recent is the edition of the *Nyāya Sūtras* at Benares (1896); also Udayanacharya's *Kusumāñjali* (Calcutta, 1895). Consult: Garbe, *The Philosophy of Ancient India* (Chicago, 1897); Max Müller, *The Six Systems of Indian Philosophy* (New York, 1899). See MIMAMSA; SANKHYA; SŪTRA; VAISESHIKA; VĒDĀNTA; YOGA.

NYBLOM, *ny'blōm*, KARL RUFERT (1832—). A Swedish poet and critic, born at Upsala. He studied at the university in his native town, and was professor of æsthetics and of the history of art and literature there from 1867 to 1897. His publications include some valuable studies of art under the title, *Estetiska studier* (1873-84). His works in poetry include: *Dikter* (1860); *Bilder från Italien* (1864, revised as *Et tår i Södern*, 1883); *Nya Dikter* (1865); *Vers och Prosa* (1870); and *Valda Dikter* (1876). Besides these original works he translated Moore's *Melodies* and the *Sonnets* of Shakespeare.

NYBORG, *ny'bōr-y'*. A seaport of Denmark, situated on the east coast of the island of Fünen, 17 miles southeast of Odense (Map: Denmark, D 3). There are an old Gothic church, and the remains of an ancient palace, formerly a royal residence, but now used as an arsenal. The harbor is accessible for large vessels, and a line of ferry-boats runs across the Great Belt to Korsør in Zealand. Nyborg is of considerable industrial importance, having large iron foundries, steam textile mills, and tobacco factories, besides a large trade in grain. Population, in 1890, 6049; in 1901, 7785. Nyborg was founded in the twelfth century, and soon became one of the foremost cities of Denmark, being the regular meeting place of the early Government assemblies.

NYCTALOPIA (Lat., from Gk. *νυκτάλωψ*, *nyktalōps*, night-blind, from *νύξ*, *nyx*, night + *ὤψ*, *ōps*, face, eye). Night-blindness. An affection of vision due rather to defective power of retinal adaptation than to defective light-sense, but resulting in a limited ability to see in a faint light. See SIGHT, DEFECTS OF.

NYCTERIBIA (Neo-Lat., from Gk. *νυκτερίς*, *nykteris*, bat + *βίος*, *bios*, life). An extremely curious genus of degraded, parasitic flies having neither wings nor balancers. It is the sole genus of the family Nycteribiidae. It resembles the Hippoboscidae in parasitic habits, and in the retention of the eggs within the abdomen of the female, until they have not only been hatched, but have passed from the larva into the pupa state. The few species are all parasitic on bats.

NYCTOTROPIC (from Gk. *νύξ*, *nyx*, night + *τροπή*, *trōpē*, a turning, from *τρέπω*, *trepein*, to turn). A term applied to those movements of plants which are called forth by variations in the intensity of the light. A later and more exact term is photoleic.

NYDIA. In Bulwer's *Last Days of Pompeii*, a blind flower-girl, of gentle birth, rescued by the hero from the slavery into which she had been sold. The story of her love for Glaucus is modeled on Mignon's passion, but is individual-

ized by her blindness, which the author handles with much art.

NYE, EDGAR WILSON (1850-96), better known as Bill Nye. An American humorist, born in Shirley, Maine, August 25, 1850. Nye's childhood was passed in Wisconsin. He went as a young man to Wyoming, studied law, was admitted to the bar there in 1876, was elected to the Legislature, and afterwards served as Postmaster and newspaper correspondent. His health failing, he returned to Wisconsin in 1883 and settled in New York in 1886, having already achieved wide popularity as a humorist, lecturer and writer. His humor consists very largely in punning and in making free with the English tongue. The more noteworthy of his books are: *Bill Nye and the Boomerang* (1881); *Forty Liars* (1883); *Baled Hay* (1884); *Bill Nye's Blossom Rock* (1885); *Remarks* (1886); *Chestnuts* (1887); *Railroad Guide*, with James Whitcomb Riley (1888); and, with the same, *Fun, Wit, and Humor* (1889); a play, *The Cadi* (1891); *Comic History of the United States* (1894); and *Comic History of England* (1896). Nye died in Asheville, N. C., February 27, 1896.

NYIREGYHÁZA, nyéréd-y'házó. A town and railway junction in the District of Szabolcs, Hungary, on the Nyir, 167 miles by rail north-east of Budapest (Map: Austria-Hungary, G 3). Situated near the Tokay wine region, the inhabitants are largely engaged in viticulture; other branches of agriculture are also profitably developed, and there are manufactures of soda, saltpetre, and matches; important annual fairs are held. Population, in 1900, 33,088.

NYKÖPING, nu'chê-ping. A seaport of Sweden, situated on an inlet of the Baltic Sea, 50 miles southwest of Stockholm (Map: Sweden, G 7). It possesses regular steamship connections with the capital city and Norrköping, and has cotton and wool spinning establishments, and an active trade in grain. Population, in 1901, 7375. In the Middle Ages Nyköping was one of the most important towns of Sweden.

NYLANDER, nu'lân-dër, **WILLIAM** (1822-99). A Finnish botanist, born at Uleåborg. From 1857 to 1863 he was professor of botany at Helsingfors, and then settled in Paris. He left his valuable collections and his library to the University of Helsingfors. Nylander wrote on the lichens of Europe and of the tropics, *Essai d'une nouvelle classification des lichens* (1854); *Prodromus Lichenographiæ Galliæ et Algeriæ* (1856); and *Lichenographiæ Novo-Granatensis Prodromus* (1863).

NYLGHAU. See NILGAI.

NYM CRIN'KLE. A pseudonym of the American newspaper writer Andrew C. Wheeler (q.v.).

NYMPH (Gk. Νύμφα, *Nympha*). In Greek mythology, a lesser divinity or spirit of the woods and streams. The nymphs are mortal, though gifted with long life and free from old age. Their homes are the groves and fountains, forests, meadows, and the sea. There were many classes of nymphs, such as the Nereids (q.v.) in the sea, the Naiads (q.v.) at the springs, and the Dryads (q.v.) and Hamadryads in the trees. The Naiads especially, as goddesses of the waters, were regarded as divinities of fruitfulness and increase. The cult of the nymphs was very

widespread, but never attained special splendor. They were worshiped with Pan in caves, or at the springs where they dwelt. In art they are found as spectators or participants in many mythological scenes, and are also represented on many reliefs dedicated by votaries at their shrines. In Greek art they are usually represented as fully draped maidens, often holding hands and dancing; the number is usually three, and sometimes Hermes appears as their leader. In later times they are commonly in the form of maidens, nude above the waist and holding before them a large mussel-shell or basin as a symbol of their control over fountains.

NYMPH (from Lat. *nympha*, from Gk. νύμφη, *nymphê*, nymph, bride). The third stage of any insect which undergoes an incomplete metamorphosis. It is an active stage, and in it the insect as a rule closely resembles the adult, except in not possessing wings. See METAMORPHOSIS.

NYMPHÆACEÆ (Neo-Lat. nom. pl., from Lat. *nymphæa*, Gk. νύμφα, *nymphæa*, water-lily, from νύμφη, *nymphê*, nymph, bride). **THE WATER-LILY FAMILY**. A natural order of more than 60 species of dicotyledonous plants growing in the mud of lakes, ponds, ditches, and slow rivers, in warm and temperate regions. Their large, long-stalked, heart-shaped or peltate leaves float on the surface of the water, and the large, often beautiful and fragrant flowers either float or are raised slightly above the water. There are usually four sepals, and numerous petals and stamens, often grading into one another. The many-celled ovary with radiating stigmas and numerous ovules in some of the genera is more or less surrounded by a large fleshy disk. The seeds have a farinaceous albumen and those of many species are used as food, as are also the root-stocks of some. See WATER-LILY; LOTUS; NELUMBO; EUBYLE.

NYORO, nyó'rò, or **BA NYORO**. One of a group of powerful Bantu tribes, living on the east side of Lake Albert Edward, Africa. They are the northernmost of the Bantu. They are as a rule good-looking, tall and well proportioned, but their countenances are disfigured by their custom of extracting the four lower incisors. The huts are conical frames, covered with thatch. Their weapons are spears, assegais or throwing spears, wooden shields, and bows and arrows. They make dugout canoes and rafts of bundles of papyrus for navigating the streams and lakes. Game and fish are caught with ingenious traps and nets. Their staple food is the sweet potato and grain, from which beer is brewed. The clan system prevails, and it is forbidden for a Nyoro to kill or eat the totem of his clan. The best defined religious practice is the worship of ancestors, which grows out of the clan system. As iron-workers, weavers, and potters they show decided skill. They number about 110,000. Consult Johnston, *The Uganda Protectorate* (New York and London, 1902).

NYRÉN, nu-rân', **MAGNUS** (1837—). A Swedish-Russian astronomer, born in the Province of Wermland, Sweden. He studied at Upsala, and in 1868 was first engaged in the Observatory at Pulkova, of which he became vice-director in 1890. Nyrén made valuable researches for the determination of the constants of precession, nutation, and aberration, and wrote: *Détermina-*

tion du coefficient constant de la précession au moyen d'étoiles de faible éclat (1870); *Bestimmung der Nutation der Erdschse* (1873); *Die Polhöhe von Pulkowa* (1873); *L'aberration des étoiles fixes* (1883); and *Variations de la latitude de Poulkova* (1893).

NYSSA. A genus of North American trees. See TUPELO.

NYSENS, né'sän', ALBERT (1855—). A Belgian politician, born at Ypres. He studied law at Ghent, and became professor in the Catholic University at Louvain. Afterwards he entered politics, was representative from Louvain in 1892, and played a prominent part in the struggle over the suffrage in 1893. Nyssens was made Minister of Industry and Labor in 1893. The labor laws he succeeded in having passed in this capacity did not suit the extremists of either party. He wrote *E. Pirmex* (1893), a

biographical sketch of the celebrated leader of the Left.

NYSTAD, nu'stád. A town in the Län of Åbo-Björneborg, Finland, situated on the Gulf of Bothnia, about 40 miles southeast of Åbo (Map: Russia, B 2). It is noted for the treaty concluded here in 1721 between Sweden and Russia, by which the territory conquered by Peter I. along the Gulf of Finland and the Baltic was conceded to Russia. Population, in 1897, 3928.

NYX (Lat., from Gk. νύξ, night). In Greek mythology, the goddess of night, called Nox by the Romans. She was the daughter of Chaos and mother, by her brother Erebus, of Day and Light. Among her children were the Mæra, Hypnos, Nemesis, Discord, and Thanatos, and some of the poets call her the mother of all things.

O

O The fifteenth letter and fourth vowel in English, and a symbol for a sound in general common to all languages. Its form is derived through the medium of Latin from the Greek, and still more remotely from the Phœnician character. In Semitic the name of the letter was *ayin*, 'eye,' having reference to the form of the letter, which must originally have been a pictograph. This Semitic letter represented a guttural breathing, the '*ain*,' which did not exist in Greek. The sign was adopted by the Greeks to represent different *o*-sounds, for the long sound of which they afterwards developed the character omega (Ω). In post-classical times the names *omicron*, 'little *o*,' and *omega*, 'big *o*,' were given to these symbols. See ALPHABET.

SOUND. In English the letter *o* is used to indicate two chief divisions of *o*-sound, first the close or 'long *o*' in *old*, *no*, etc., which is sometimes represented also by digraphs, as in *sew*, *dough*, *tow*; second, the open or 'short *o*,' which may be wide, as in *hot*, *rot*, or narrow, as in *shorn*, *lord*. The main source of the English long *o* is an Old English $\ddot{a}$, Germ. *ei*, Goth. *ai*, as in Eng. *stone*, A.S. *stān*, Germ. *Stein*, Goth. *stains*; the short *o* is usually a retention of a West Germanic *o* as in *gold* (A.S. *gold*, Germ. *Gold*). As a graphic device, moreover, *o* is sometimes used to express a *u*-sound, as in *who*, *wolf*, *love*, *monk* (A.S. *mumuc*), etc. This spelling is really not orthographic, but was due to the Anglo-Norman scribes adopting a looped *o* instead of *u* when adjoining an angular pointed letter like *m*, *w*, *n*, *v*, where the vowel could not readily be distinguished by the eye. In some words this has even affected the pronunciation, as in 'sovereign,' and often 'wont.'

AS A SYMBOL. In mediæval notation as a numeral *o* = 11; in chemistry *O* = oxygen; in logic it is the sign of the particular negative proposition; and it is common in abbreviations, O.T. = Old Testament; O.H.G. = Old High German, etc.

OAHU, ʻŌʻĪhū. One of the Hawaiian Islands (q.v.).

OAJACA, wā-hŭ'ká. A State and a city of Mexico. See OAXACA.

OAK (AS. *ác*, OHG. *eih*, Ger. *Eiche*, oak; connected with Lat. *æsculus*, Gk. *αἰγίλωψ*, *αἰγίλωψ*, oak), *Quercus*. A genus of trees and shrubs of the natural order Cupuliferæ, having a three-celled ovary, and a round (not angular) nut

(acorn) placed in the lower part of and invested by a scaly truncated cup. The species number about 300 and are natives of temperate and tropical countries. Several are found in Europe. North America produces many, and many are natives of Asia, especially of mountainous regions. None are found in tropical Africa, in Australia, or in South America except in the most northern parts. The oaks have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous, when they have well-developed winter buds.

OAK (*Quercus alba*).

The oaks are famous for the strength and durability of their timber, the majesty of their appearance, and their great longevity. They reach maturity in from 120 to 200 years, depending upon the species, and well-attested specimens are known to be nearly 1000 years old. Some species rise tall and stately to a height of from 50 to

100 or even 150 feet, and have thick trunks and wide-spreading branches. The trunk is often four, six, or even eight feet in diameter. The oak succeeds best in loamy soils, and especially in those that are somewhat calcareous. The timber is very solid, durable, peculiarly insusceptible of the influence of moisture, and therefore eminently adapted to ship-building. It is also employed in carpentry, mill work, etc. The bark abounds in tannin, and contains a peculiar bitter principle called quercine, and is used in medicine, chiefly in gargles, on account of its astringency, sometimes also as a tonic; it is used along with gall-nuts in the manufacture of ink; but most of all for tanning (see *BARK*), on which account the oak is often planted as copse-wood (see *COPSE*) in situations where it cannot be expected to attain great size as a tree. The acorns of some trees

cork of commerce is obtained, is a native of Spain and the north of Africa. (See *CORK*.) The Valonia oak (*Quercus Egilops*), of Eastern Europe and Asia and extensively planted in Algeria and elsewhere, is celebrated for the amount of tannin contained in its acorns and cups, large quantities of which are used in tanning leather. The gall oak (*Quercus lusitanica*), a common, low shrub native of Asia Minor, is noted for the galls produced upon its leaves by insects.

In the United States more than 50 species of oaks are found with a score or more additional described varieties and hybrids. Some species are very restricted in their distribution, being known from only a single locality, where others range from Maine to Minnesota and southward to the Gulf of Mexico. The American species, and

OAK LEAVES.

1, Black oak (*Quercus velutina*); 2, Live oak (*Quercus Virginiana*); 3, Rock Chestnut oak (*Quercus prinus*); 4, Pin oak (*Quercus palustris*); 5, Black Jack oak (*Quercus Marylandica*); 6, Cork oak (*Quercus suber*); 7, Spanish oak (*Quercus digitata*).

are also much less bitter than others, and species occur which produce acorns as sweet as chestnuts.

Economically considered the principal oak of Europe, also distributed over Western Asia, is *Quercus robur*, the British oak, of which there are two well-known varieties, *pedunculata* and *sessiliflora*, so named because in the former the acorns have stalks, in the latter not. These and other differences in habit have no apparent influence upon the value of the timber. Of these varieties, which some botanists call distinct species, *pedunculata* is more abundant in the north and *sessiliflora*, often called durmast oak, in the south. The Turkey, or Adriatic oak, sometimes called Austrian oak (*Quercus Cerris*), native to Southeastern Europe, is large and valuable and extensively planted. Its leaves are acutely lobed and the cups of the acorns have long acute bracts, from which it is called mossy-cupped. The holm or evergreen oak (*Quercus Ilex*) is an evergreen species occurring commonly in the south of Europe. It is more fully described under *Ilex*. The cork oak (*Quercus Pseudo-suber*), from the bark of which the

possibly the others, readily fall into two great groups, the white oaks and black oaks, respectively, the former with round-lobed, never bristle-tipped leaves, and acorns which ripen the first year; the latter with acute bristle-tipped leaf lobes, and fruits which mature the second year. The American white oak (*Quercus alba*), a large tree of rather rapid growth and tough, hard, strong, close-grained wood, is one of the most valuable of timber trees. It is found from Canada to the Gulf and west to Texas. The bur oak, or mossy-cup oak (*Quercus macrocarpa*), is a large tree of much the appearance and distribution of the white oak and is one of the most valuable oaks for Western planting. Its timber is coarser grained and not so strong, but otherwise equals that of the former species. The red oak (*Quercus rubra*) and the scarlet oak (*Quercus coccinea*) are large, valuable trees that occupy about the same territory. They belong to the second class of oaks mentioned above. Their timber is coarse-grained, heavy, hard, and strong, and is used in various kinds of building and for furniture. No difference between the

OAKS

1. SCARLET OAK (*Quercus rubra*).

2. WHITE OAK (*Quercus alba*).
3. SPANISH OAK (*Quercus digitata*).

two is noticed in the lumber trade. The chestnut oak (*Quercus Prinus*) is a large tree with a deeply furrowed bark and leaves resembling those of the chestnut. The bark, which is rich in tannin, is used extensively in tanning leather. The chinquapin oak (*Quercus acuminata*), and the dwarf chinquapin oak (*Quercus prinoides*), by some botanists referred to *Quercus Prinus*, bear edible acorns. The yellow oak, or quercitron (*Quercus tinctoria*), or *Quercus discolor* of some botanists, yields a valuable bark for use in tanning, and a dyestuff, quercitron. The live oak (*Quercus virens* or *Quercus Virginiana*) is found growing in the rich soil of moist climates from Virginia to Texas, also in California, Mexico, Central America, and Cuba. It is one of the hardiest of the evergreen oaks, attaining a height of 60 feet or more, and six to eight feet in diameter. It was formerly extensively used in ship-building. The Spanish oak of the southeastern United States is variously called *Quercus digitata* and *Quercus dilatata*, the latter name being also applied to an East Indian species.

The name oak is given to many other trees and plants not related to *Quercus*. The African oak is a kind of teak (q.v.). In Australia a number of species of *Casuarina* (q.v.) are called oak, as are also species of *Grevillea*, *Lagunaria*, etc. *Rhus toxicodendron* is often called poison oak in the United States, etc. Fossil oak leaves are known in the Cretaceous rocks, where are also found some forms intermediate between the oaks and chestnuts. These latter indicate for the two genera *Quercus* and *Castanea* a common ancestry in early Cretaceous times. In the Tertiary oaks were prominent members of the vegetation and ranged to far northern latitudes, for their leaves are found in the Lower Eocene beds of Disco Island, on the west coast of Greenland.

OAK APPLE, or GALL. See GALL-INSECTS.

OAK CROWN, ORDER OF THE. A civil and military order of Luxemburg, founded in 1841 by King William II. of the Netherlands. It has five classes and is conferred on distinguished artists. The decoration is an eight-pointed silver star, with a golden W beneath the royal crown on a green field, surrounded by an oak crown. The cross is suspended from an orange ribbon with three green stripes. The motto is *Je maintiendrai*.

OAKELEY, ók'li, Sir HERBERT STANLEY (1830-1903). An English organist and composer, born at Ealing, Middlesex. He was educated under native teachers, and at Oxford University. Later he studied at the Leipzig Conservatory and privately (organ) with Schneider of Dresden and Breidenstein of Bonn. He held several university appointments as lecturer on musical topics, and held high degrees from most of the leading universities of Great Britain. He was composer (in Scotland) to Queen Victoria, and was knighted by her in 1876. His organ recitals were famous throughout the United Kingdom. His compositions include the Cantata *Jubilee Lyrica*, a sonata op. 20, considerable church music, songs, and an orchestral "suite in the olden style" (1893).

OAKES, óks, URIAN (1631-81). An American colonial clergyman and poet, born in England. He was brought to Massachusetts in 1634. He graduated at Harvard in 1649, and showed his

precocity by the early publication at Cambridge of a set of astronomical calculations, and shortly afterwards accepted a pastorate at Titchfield, England. His Non-Conformist views compelled him to relinquish his pastorate in 1662, although later he preached to another congregation. On account of his learning and piety he was chosen pastor of the church in Cambridge, Mass., where he began his labors in 1671. He accepted the presidency of Harvard College in 1675 (being formally installed five years later), and held this position until his death, which occurred in Cambridge, Mass., July 25, 1681. He was an eloquent preacher, but is remembered chiefly for *Elegy Upon the Death of Thomas Shepard* (1677), one of the best and most elaborate of early colonial poems. This poem has been more than once reprinted. For specimens and criticism, consult Tyler, *History of American Literature*, ii., 15-18, 163-167.

OAK INSECTS. The insect fauna of oak is very extensive. Between 500 and 600 species of insects have been recorded that live upon the different species of *Quercus*, and there are in addition many other species which live in decaying oak wood and oak stumps. In Germany 537 species of insects of all orders have been recorded by Kaltenbach as preying upon the oaks of that country. It has been estimated that it is not improbable that 1000 species of oak insects exist in the United States. The roots of the live oak, and probably of the water oak, are infested by a great longicorn borer (*Melodon melanopus*) by which the trees are permanently dwarfed and their growth arrested. There are several species which burrow into the trunk, the most prominent being the caterpillar of the carpenter moth (*Prionoxystus robiniae*), which occurs from New England to Texas and honeycombs the wood with large black burrows. Several flat-headed borers (Buprestidæ) and many bark-boring beetles (Curculionidæ) affect oak.

OAK-PRUNER.

a, Adult beetle (*Elaphidion villosum*); b, end of twig severed by larva from tree; c, reverse end containing maggot; d, same from side, split to show pupa within it.

The oak-pruner (*Elaphidion villosum*) and the periodical cicada (see CICADA) cut off the twigs and small limbs. The leaves of various oaks are eaten by many species of lepidopterous larvæ, the most prominent being the forest tent-caterpillar (*Climacampa disstria*) and the large black and red striped spiny caterpillar of *Anisota senatoria*. These two caterpillars in the Atlantic and Central States, as a rule, do more harm to oak forests than all other species combined.

Several species of leaf-rollers (q.v.) are found upon oak, and leaf-miners (q.v.) frequently dis-

figure the leaves. There are also plant-lice and scale-insects which are confined to the trees of this kind, and the so-called gloomy scale (*Aspidiotus tenebri-cosus*) frequently endangers the life of half-grown trees, while the imported oak-scale (*Asterodiaspis quercicola*) enfeebles the trees in many localities, disfiguring the smaller branches by pitting the tender bark with its peculiar depressions.

A striking characteristic of the insect fauna of oak is the occurrence of many kinds of galls produced mainly by gall-flies of the hymenopterous family Cynipidæ. One hundred and eight distinct species of gall-flies live upon oaks in the United States, each species making its characteristic gall either upon the roots, the twigs, the buds, or the leaves. Some of the most striking of the oak galls are: The oak potato-gall, the large, hard, uneven swelling resembling a potato in shape, growing upon white oak twigs and attaining a length of two inches or more; the wool-sower gall, which consists of a round mass resembling wool, from the size of a walnut to that of a goose-egg, growing on the side of or surrounding white oak twigs in June, pure white in color tinged or speckled with rose-red; and the oak cup-gall, which consists of a very curious swelling on the acorn-cups, terminating in a bunch of curly, woolly fibres. Several galls are made by dipterous insects of the gall-midge family, Cecidomyiidae. Consult Packard, *Fifth Report, United States Entomological Commission* (Washington, 1890).

OAKLAND. A beautiful residential city and the county-seat of Alameda County, Cal., six miles across the bay from San Francisco; on the Southern Pacific Railroad (Map: California, B 3). Oakland, named from the number of ever-green oaks within its limits, has a healthful climate, is surrounded by beautiful scenery, and possesses fine drives and wide and level streets, 146 miles paved, a great proportion with macadam, and five miles with bitumen. Steam ferries connecting with San Francisco and eighty miles of street railway demonstrate the city's accessibility as a residence district. Many of its private dwellings are finely situated and are notable structures. Particular mention may be made also of Macdonough Theatre, the public library, which contains nearly 30,000 volumes, the high school, and other public school buildings, as prominent architectural features. Oakland is the seat of California College (Baptist), established in 1870. Lake Merritt, south of the city and connected with San Francisco Bay by a narrow inlet entering an indentation of the bay, is a popular resort.

The city, adjacent to a fertile agricultural and fruit-growing region, controls a large commerce as a railroad terminus and as a shipping centre, both vessels and cars meeting here to exchange commodities. With its manufacturing advantages it also has important industrial interests—ship-building yards; marble, smelting, and metallurgical works; flour, cotton, quartz, and planing mills; fruit-canning works; cordage, carriage, jute, and windmill factories, etc. The government is vested in a mayor, elected every two years, a unicameral council, and in subordinate administrative officials, the board of health being appointed by the executive, and all other officers chosen by popular vote. Oakland spends an-

nually, in maintenance and operation, about \$785,000, the principal items of expense being \$295,000 for schools, \$100,000 for the police department, \$90,000 for the fire department, \$70,000 for municipal lighting, and \$55,000 for street cleaning and sprinkling. The bonded debt of the city is about \$400,000, and the assessed valuation of property, real and personal, amounts to \$45,000,000. Oakland was settled about 1850, was incorporated as a town in 1852, and was chartered as a city in 1854, though in 1860 there were only 1543 inhabitants. Population, in 1870, 10,500; in 1880, 34,555; in 1890, 48,682; in 1900, 66,960, including 17,300 persons of foreign birth and 2200 colored persons.

OAK-LUNGS. A species of lichen. See LUNGWORT.

OAKS, THE. One of the most important English horse races, run at the Epsom Summer Meeting on the Friday following the Derby. The race is confined to three-year-old mares.

OAKUM (AS. *acumba*, *acemba*, OHG. *achambi*, tow, oakum, from AS. *ā*, out + *cemban*, to comb). A tangled mass of tarred hempen fibres, made from old rope by untwisting the strands and rubbing the fibres free from each other until it is in about the same condition as the loose tow of which it was made originally. Its principal use is in calking the seams between planks, the space round rivets and bolts, and the joints of water and other pipes, to prevent leakage. It is sometimes used in dressing wounds. White oakum is made from untarred hemp.

OANNES, ō-ān'nēz. The name of a Babylonian god found in the fragments of Berosus (q.v.). It is said that in the first year of the foundation of Babylon he came out of the Persian Gulf. He is described as having the head and body of a fish, to which were added a human head and feet under the fish's head and at the tail. He lived among men during the daytime, without, however, taking any food, and retired at sunset to the sea, from which he had emerged. Oannes instructed men in the use of letters, and in all the principal arts and sciences of civilization, which he communicated to them. The story has not yet been found among the remains of Babylonian literature, and we are dependent, therefore, largely upon conjecture in attempts to identify Oannes with any of the Babylonian deities known. He is evidently the deity supposed to reside in the Persian Gulf, and this fact points to his identification with Ea, the chief deity of Eridu, a city that once lay at the Persian Gulf. Ea is a prominent figure in the religious literature and is distinctly a water-deity. He is also portrayed as the source of wisdom to whom Marduk (see MERODACH), the head of the Babylonian pantheon, goes for advice, and the fact that Marduk is represented as the son of Ea points to the great antiquity of the Ea cult and the reverence in which it was held. On Assyrian sculptures and on seal cylinders we find frequently the body of a man, but covered with fish scales, and it is likely that this is a representation of Ea. A difficulty, however, remains in accounting for the curious name; which yet must in some way be connected with Ea. Consult Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898).

OAR-FISH. One of the band-fishes or ribbon-fishes of the genus *Regalecus*, family *Regalecidae*.

WHITE OAK

WHITE OAK (*Quercus alba*), Santa Ynez Valley, California.

The body is much elongated and at the same time attenuated and compressed. The dorsal fin extends the whole length of the back, and the ventral fins consist only of a single long ray and

BANKS'S OAR-FISH (*Regalecus Banksi*).

often are dilated at the end; the mouth is small. Specimens 20 feet long have been taken. The anterior portion of the dorsal fin is produced so as to suggest a mane, and it is probable that most of the so-called sea serpents are referable to this fish. The only species (*Regalecus Banksi*) is cosmopolitan in its distribution. Compare UNICORN-FISH.

OÁS, ó-as'. A town of Southern Luzon, Philippines, in the Province of Albay. It is situated on the main road, 16 miles northwest of Albay (Map: Philippine Islands, H 6). Oás is the centre of an important hemp-growing region, and carries on a considerable river trade. Population, in 1896, 15,987.

OASIS, ó'a-sis (Lat., from Gk. *oasis*, oasis; connected with Copt. *ouahe*, dwelling-place, oasis, from *ouih*, to dwell). A fertile place in a desert. As the barren condition of most deserts results from small rainfall, the presence of oases depends upon the occurrence of springs or streams which can be utilized for irrigation. In the Sahara there are mountains of sufficient height to provoke precipitation, and the neighboring lowlands may thus receive sufficient water to support vegetation. A water supply is frequently obtained also from wells located at considerable distances from regions of precipitation. A combination of soil that holds water, but prevents evaporation, is sometimes found, and greatly favors the formation of oases. See ARTESIAN WELLS.

OAT (AS. *äte*, of unknown derivation). Numerous species of plants of the genus *Avena*, belonging to the order Gramineæ, or grasses. The commonest species, characterized by loose panicles instead of spikes of flowers as in the case of wheat, barley, and rye, is of unknown nativity, but it is believed to have been derived from a single prehistoric form, probably a native of eastern temperate Europe and of Tatar.

The common cultivated varieties of oats are classified under two groups, or types, based on the form of the panicles, namely, common oats with open spreading panicles, and Tartarian oats with contracted one-sided panicles. These types are sometimes considered as distinct species, the former as *Avena sativa*, the latter *Avena orien-*

talís. In general the varieties of oats differ in the color and thickness of the husk, the form of the grain, the length of the straw, and the time of ripening. In color they are usually yellow, white, or black. There are a number of species of but little importance, such as wild oats (*Avena fatua*), which is generally considered as a weed, but has become an abundant and valuable wild pasture grass in California; bristle-pointed oats (*Avena strigosa*), also a weed, but sometimes grown for green fodder; animated oats (*Avena sterilis*), so named from the fact that when the dry awn absorbs moisture it untwists and thus gives motion to the grain; and short oats (*Avena brevis*), cultivated for its grain at high elevation in the mountainous parts of France and Spain, ripening where other kinds do not, and also grown as a forage plant in other parts of Europe. See COLORED PLATE OF CEREALS.

The oat is a hardy plant, especially well adapted to temperate climates, and is not cultivated to any great extent in hot countries. It is extensively grown in the United States and Canada, in Great Britain, and in the countries of Northern Europe. It succeeds best in a cool, moist climate, but it will grow quite well in warmer regions if the soil is sufficiently moist. In hot and dry regions it grows very poorly. Oats are not a fastidious crop as to the character of the soil, and will grow on light or heavy soils, but are intolerant of excess of water. The seed-bed for oats is prepared about the same as for wheat and barley, but not quite so deep. In the Eastern United States the land is usually plowed before the oats are sown, but in the Western States, especially in new and fertile regions, they are frequently sown on corn land without plowing and covered with a corn cultivator or disk harrow, the surface of the soil being then smoothed with an ordinary harrow. When sown on unplowed land oats are always broadcasted, and on plowed ground the practices of both drilling and broadcasting prevail. On the whole, the greater portion of the crop is broadcasted. From two to three bushels of seed is the usual quantity sown per acre. Oats are sown in the spring and in the fall. Spring-sown oats represent the bulk of the crop, while fall-sown or winter oats are limited to southern localities. When sown as early in the spring as possible the crop has the advantage of making most of its growth during the cooler part of the season, which is best adapted to its development. In northern latitudes it ripens in ninety days, or even less, but in southern regions a longer time is required.

From forty to sixty bushels per acre is considered a good yield, but much larger yields are sometimes obtained. Russia and the United States are the greatest oat-producing countries of the world. In 1899 the United States produced 796,177,713 bushels. The average yield per acre in the United States for the years 1890 to 1899, inclusive, was about 26.14 bushels. The highest average yields, about 40 bushels per acre, are produced by Germany and Great Britain. The oat, although quite free from insect enemies and plant diseases, is subject to rust and loose smut in a way similar to wheat. (See RUST; SMUTS.) Early maturing varieties are usually preferred because they often ripen before rust becomes injurious to the crop, and, on account of being

shorter in the straw, they are not so apt to lodge as late varieties. For a concise treatise on the culture of oats, consult Morrow and Hunt, *Soils and Crops of the Farm* (Chicago, 1892).

FOOD AND FEEDING VALUE. The oat plant furnishes green forage, hay, and straw, while the ripe grain and its milling products are of great importance as foods and feeding stuffs. The grain has long been used as a food for man, in the United States chiefly as a breakfast food. In the following table the average percentage composition of a number of oat products is shown:

AVERAGE COMPOSITION OF A NUMBER OF OAT PRODUCTS

	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Oat forage.....	62.2	3.4	1.4	19.3	11.2	2.5
Oat hay.....	15.0	9.3	2.3	39.0	29.2	5.2
Oat straw.....	9.2	4.0	2.3	42.4	37.0	5.1
Whole oats.....	11.0	11.8	5.0	59.7	9.5	3.0
Oat hulls.....	7.3	3.3	1.0	52.1	29.7	6.7
Oat bran.....	7.7	7.1	2.3	57.9	19.3	3.7
Oat shorts, middlings or "feed".....	7.7	16.0	7.1	59.4	6.1	3.7
Oat dust.....	6.5	13.5	4.8	50.2	18.2	6.9
Oat meal.....	7.3	16.1	7.2	66.6	0.9	1.9
Rollod oats.....	7.7	16.7	7.3	64.9	1.3	2.1

Oat forage and hay compare favorably with similar products from the common grasses. (See HAY.) Oat straw contains a higher percentage of crude fibre than the hays, due to the fact that as the plant ripens the percentage of crude fibre increases. Hay and straw may be fed whole or chopped. The oat grain is rich in protein and carbohydrates and contains a fairly high percentage of fat. It is very valuable for all classes of farm animals, though it is perhaps most commonly thought of as a feeding stuff for horses. It has been claimed that oats contain a peculiar stimulating principle, 'avenine,' to which is due their especial value as a horse feed. Careful analysis fails to detect 'avenine,' and the common opinion now is that there is no such substance in the oat. Although the reason is not definitely

When oats are low in price they may be profitably fed to sheep for the production of mutton. Like wheat, they induce growth rather than the production of fat. When it is desired to fatten lambs some corn should be fed with the oats. Oats are useful for poultry, ground oats being very valuable as one of the constituents of the morning ration.

The different milling and by-products obtained from oats resemble the whole grain more or less closely. The hulls represent the loose outer covering of the grain, and the shorts (called also middlings or feed) and the bran consist of the

outer layers of the kernels. After the grain is hulled in milling the little tuft of hairs on the end of the kernel is removed. These accumulate and constitute the basis of 'oat dust.' The material, which should also contain some broken kernels, is a useful feeding stuff provided it does not also contain too much mill sweepings. The hulls resemble the straw in composition and are not regarded as an especially valuable feed. The bran and middlings contain a large amount of nutritive material in proportion to their bulk. The oat feeds marketed under various trade names are mixtures of the different oat by-products with or without other materials, and differ in nutritive value, some being much more valuable than others. The average coefficient of digestibility of a number of oat products follows:

COEFFICIENTS OF DIGESTIBILITY OF A NUMBER OF OAT PRODUCTS

	Total dry matter	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Oat forage.....	59.5	71.8	69.2	62.6	52.8	53.4
Oat hay.....	49.3	54.2	61.9	52.0	43.5	34.6
Oat straw.....	50.3		38.3	53.2	57.6	
Oats whole.....	72.4	86.1	82.4	79.4	31.1	33.1
Oats ground.....	75.7	82.4	79.9	86.1	14.4	29.2
Oat feed.....	62.0	81.1	89.0	67.4	42.6	

known, practically all are agreed that horses fed oats excel in mettle and general condition—and it is certain that no feeding stuff is eaten with greater relish. Oats are usually fed unground to horses—grinding being necessary only for foals and for animals whose teeth are not good. New oats should not be fed to work-horses, as they cause looseness of the bowels and render the animals liable to sweat easily and put them out of condition. The reason for the bad effects of new oats is not definitely known. For very young pigs, oats should be ground and the hulls removed by sieving. For more or less mature pigs and for breeding stock some oats, either ground or unground, are very desirable.

OATES, öts, TITUS (1649-1705). The principal informer in the so-called Popish Plot in England. He was born at Oakham, and in 1665 entered the Merchant Taylors' School, but was expelled the first year. After that he went to Sedlescombe School, and from there to Gonville and Caius College, Cambridge, and later to Saint John's College. Though he never took a degree, he contrived to be ordained, and in 1673 was appointed vicar of Bobbing in Kent. The following year he became curate to his father at All Saints in Hastings, but both were expelled for having invented a scandal concerning a school-master there. Moreover, Titus Oates was thrown into prison. Escaping from prison, he became

a chaplain in the navy, but was soon expelled. He now obtained the position of chaplain to the Protestant members of the Duke of Norfolk's household. Here he met a number of Catholic priests, and presumably first contrived his plot of informing against Catholics. He associated with himself in 1676 a fellow clergyman, Israel Tonge, and together they planned the various schemes. In order to carry these out, Oates pretended to become Catholic, and in 1677 was sent to the Jesuit College at Valladolid, and afterwards to Saint Omer, but from both he was expelled for misconduct, and in 1678 returned to England. Taking advantage of the hostile state of the public mind toward the Catholics, Oates and Tonge induced, in 1678, a Lancashire gentleman, Christopher Kirkby, to reveal to the persons interested fictitious details of a plot of Roman Catholics to murder Charles II. and make the Duke of York King. Terrible excitement resulted in London, and by the perjured testimony of Oates and his followers, about thirty-five people lost their lives between 1678 and 1681, while Oates himself for a time received a large pension, lived in Whitehall Palace, and enjoyed great favor. A reaction, however, set in, and in 1684 he was imprisoned. Upon the accession of James II. Oates was found guilty of perjury and sentenced to be pilloried, whipped, and afterwards imprisoned for life. Rather unexpectedly he survived the terrible flogging, and after the Revolution of 1688 he was set at liberty. He died July 12, 1705. Consult: Burnet, *History of His Own Time* (London, 1883); Lingard, *History of England*, vols. ix., x. (ib., 1855); Macaulay, *History of England*, vol. i. (New York, 1856-62).

OAT GRASS. A popular name of a number of grasses whose inflorescence somewhat resembles the oat panicles, among them certain species of *Avena*, to which the oat belongs. Various species of *Danthonia* are called oat grass, but are not considered valuable either for hay or pasture. The best known oat grass is *Arrhenatherum elatius*, a tufted perennial grass introduced into America from Europe, where it is highly prized for hay. It is common east of the Mississippi River and is grown in the Southern States for hay and winter pasturage. It grows rapidly, resists drought well, and yields a large amount of leafy fodder, especially upon light soils. In some regions upon good soils if cuttings be made as soon as the grass is in flower or before, three or four cuttings may be made during the season. After flowering it quickly becomes woody and less valuable.

OATH (AS. *ap*, Goth. *aips*, OHG. *eid*, Ger. *Eid*, oath; connected with OIr. *oeth*, oath). A declaration or compact, in which the declarant confirms the truth of his assertion by invoking supernatural penalties on his head in the event of perjury. The punishment is often ceremonially represented, as when a victim is sacrificed, and the person making a pledge expresses a desire that he himself, if he prove false, may undergo a like fate. In Aracan, a native swears on a sword, a crocodile's tooth, or a thunderbolt (stone celt). The implication is that the weapon may wound him, the crocodile devour him, or the god who hurls the lightning smite him. In the Hebrew ritual a sacrificial beast was cut in pieces and burned; the oath-taker then passed through the fire, in order to symbolize the fate which

would punish his falsehood. Quite similar was the ancient Greek usage, in which an animal was slaughtered, and the pieces thrown into the sea; or the victim might be burned on the altar; hence perhaps it became common to take oaths before altars, where the swearer touched the holy things, or raised his eyes and hands to heaven, where was supposed to dwell the deity who watched over the sanctity of compacts. Oaths were usual in the case of every solemn agreement, public or private, relating to business, war, or politics; of this practice survivals remain in our official and judicial custom.

In law, an oath is a solemn declaration or pledge, made by a person of discretion, before a properly authorized officer, to the effect that a thing stated or promised by him is true, and with some ceremony believed to be binding on the conscience of the declarant, as by an appeal to God to witness his good faith.

With the development of Roman jurisprudence the practice of thus insuring the truthfulness of witnesses in legal actions became fixed and common, and continued in the civil law. In England, up to the time of the reign of William and Mary, no one could testify in a court of justice who did not believe in God, and recognize the doctrine of future punishment for sins. By the Toleration Act, 1 William and Mary, c. 18, § 13, Quakers were permitted to make a declaration of fidelity to the State, instead of the oath of allegiance; and by 7 and 8 William and Mary, the solemn affirmation of Quakers was made of equal weight with an oath, and was allowed in judicial proceedings when the privilege was claimed. In 1854 Parliament passed the 'Common Law Procedure Act,' 17 and 18 Vict., c. 66, § 1, permitting any one whose conscience prevented him from taking an oath, or who did not believe in its binding efficacy, to make a solemn affirmation instead. The 'Oaths Act,' 51 and 52 Vict., c. 46, made further liberal provisions in regard to oaths and affirmations.

With reference to their legal effect, oaths are considered assertory, judicial, or extra-judicial. An *assertory* oath is one required by law other than one for use in judicial proceedings, as an oath of office, or a revenue or custom-house oath. False swearing in such a case does not amount to perjury, but in most jurisdictions, and in the acts of Congress, there are statutory provisions making it a crime. A *judicial* oath is one required by law in, or for use in, a judicial proceeding, and a false statement made under such an oath is punishable criminally. An *extra-judicial* oath is one which is voluntarily taken, and not intended for use in a legal proceeding, as an oath taken merely to convince some one in a private transaction of the good faith of the declarant. Its falsity does not constitute a criminal offense.

The most important class of oaths affecting the general public are those which are required to enforce the truth from witnesses in courts and legal proceedings. Where a statute requires an oath to be administered, it is held that only persons having sufficient understanding to know the nature and obligations of such a ceremony may be sworn. Therefore, children and mentally deficient persons who are not able to comprehend the difference between right and wrong are often excluded from testifying in legal actions. In most of the United States a witness may either

swear or affirm. False testimony in either case amounts to perjury. An extra-judicial oath is said to be binding only *in foro conscientie*—that is, morally; but it is not legally binding upon the person taking it. An example of such an oath is the common one to abstain from the use of intoxicating liquors.

The statutes of each State prescribe the various officers who shall administer oaths for different purposes. Judges, clerks of courts, referees, justices of the peace, and coroners usually administer oaths to witnesses, and notaries and commissioners of deeds commonly take oaths outside of court for use in judicial proceedings, or to authenticate legal instruments. A person authorized to administer oaths cannot delegate his powers, except that where an officer, such as a sheriff, is authorized to appoint a deputy, it is usually held that the deputy represents his principal for all purposes including the administration of oaths. An oath should be administered strictly in the form prescribed by statute and by a competent officer. For example, it has been held, where a statute prescribed the form of an oath which ended with the words, "so help me God," that the omission of such words would invalidate it. The oath administered to a person subscribing and swearing to an affidavit is usually in the following form: "You do solemnly swear that the contents of this affidavit by you subscribed are true, so help you God." Hebrews are often sworn on the Pentateuch, keeping on their hats, and their oath ends with the words, "so help me Jehovah." A Mohammedan is sworn on the Koran; a Chinese witness in the Western States is sometimes sworn by his kneeling, breaking a saucer, and uttering an imprecation that his "soul may be broken into as many pieces as the saucer" if he does not tell the truth. The tendency at present is to consider that the statutes against perjury and false swearing have a more potent effect than religious fears in deterring a witness from making false statements, and accordingly it is not considered of as great importance whether a witness swears or affirms that his testimony will be true. See AFFIDAVIT; EVIDENCE; NOTARY PUBLIC; PERJURY; WITNESS. Consult the authorities referred to under EVIDENCE; PROCEDURE; CRIMINAL LAW.

OATHS, MILITARY. Article 2 of the Articles of War, United States Army, prescribes that every enlisted man shall, within six days after his enlistment, take oath or affirmation in the following form: "I, A. B., do solemnly swear (or affirm) that I will bear true faith and allegiance to the United States of America; that I will serve them honestly and faithfully against all their enemies whomsoever; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to the rules and articles of war." In England all soldiers take a similar oath, swearing fealty, allegiance, and obedience to the King, his heirs, and those placed in authority under him. The most impressive ceremony is that arranged by the German Emperor William II., who follows the custom of the ancient armies, and swears in the recruits of the guards regiments en masse. Officers sitting on courts-martial and witnesses testifying are required to take oath or make affirmation. This

latter is a rule in all armies throughout the world.

OAXACA, wa-hā'ká, or **OAJACA**. A Pacific State of Mexico, bounded by the States of Puebla and Vera Cruz on the north, Chiapas on the east, the Pacific Ocean on the south, and Guerrero on the west (Map: Mexico, L 9). Its area is 35,382 square miles. The whole State, with the exception of a low, sandy belt along the coast, is covered with the numerous southern ramifications of the Sierra Madre, inclosing many fertile and beautiful valleys. The slopes are covered with abundant timber, and the State is watered by a multitude of streams. The climate is for the most part temperate and healthful. The soil is very fertile and yields abundant crops of sugar, coffee, cacao, tobacco, cotton, and other tropical and semi-tropical products. Stock-raising is also an important industry, but the mineral deposits, though very rich, are but little worked. The State is traversed by two railway lines and has good roads. There is also steamship communication through the ports of Salina Cruz and Puerto Angel. Population, in 1900, 947,910. The capital is Oaxaca (q.v.).

OAXACA, **OAJACA**, or **OAXACA DE JUAREZ**. The capital of the State of Oaxaca, Mexico. It is situated in a beautiful valley in the centre of the State, 82 miles from the Pacific coast and 225 miles southeast of Mexico City (Map: Mexico, K 9). It is the chief centre of population in Southern Mexico, the terminus of the Mexican Southern Railroad, and is well built, with large squares and public parks. The notable buildings and institutions are the Government building, the Cathedral, the Institute of Arts and Sciences, the public library, and the Museum of Antiquities and Natural History. Owing to its isolated position, it is not one of the important industrial cities of the Republic, but it has some thriving local industries, especially the spinning and weaving of the pita fibre. A United States consular agency is located here. Population, in 1895, 32,641. Oaxaca was founded by the Zapotecs in 1486, under the name of Huaxyacac, and was occupied in 1522 by the Spaniards, who named it Antequera. Juarez was born here.

OAXACA, RUINS OF. Enormous works of the ancient Mexicans near the city of Oaxaca. The whole range of Monte Alban as seen in profile gives evidence of artificial modification. On ascending the summits one is amazed at the display of pyramids, terraces, quadrangles, and mounds covering every available space, and one finds that the whole mountain has been remodeled by the hand of man at cost of immense labor. The greatest of these works is located on the summit of Monte Alban at 1000 feet elevation, and covers an area of 3400 by 1200 feet, sculptured into a vast series of level courts, inclosed by successive terraces and bordered by pyramids. The quadrangles are flanked at the corners by pyramids, and in the centre is a mound, the ruins probably of a temple. One of these pyramids is 400 feet square and rises 40 feet to the summit, which is 300 feet square. Another court, or plaza, is a level, sunken field 600 feet wide and 1000 feet long, inclosed by pyramids and terraces and having a line of four pyramids ranged along its centre. It has been found that these constructions, no matter how situated with regard to the mountain profile, are accurately oriented, as are the ruins

of Mitla (q.v.), some thirty miles away, and it is conjectured that the same people were their authors. In the absence of suitable building stone at Monte Alban, the builders employed cores made up of small stones and adobe faced usually with small rough blocks, but sometimes with dressed masonry, and covered with cement on the exterior. There is no evidence that the surface was finished in fresco as at Mitla. Cement floors may also be observed in the ruins, and there are traces of strong walls. Little sculpture has been found, the principal examples being a serpent carved from quartzite originally on the face of a pyramid, and two colossal turbaned heads in low relief cut in limestone. The pottery scattered on the surface and in the debris is of slate color like the ware sold in Oaxaca market. The makers of the old ware decorated their vessels with raised ornaments and modeling. Innumerable small amulets of jadeite and other hard stone in form of a rudely carved human figure are found. These objects show drilling, sawing, and other methods of stone-working. A few gold and copper objects have been taken from the ruins.

Prof. W. H. Holmes, who made a careful examination of Monte Alban in 1896, concludes that we have there the remains of a hill-top city occupied by a population which utilized for their crops the rich valley in which the city of Oaxaca stands, and covered the mountain slopes with their garden plots. There are also evidences of other cities in the valley. In the State of Guerrero, directly west of Oaxaca, are many square miles of similar ruins covering the slopes of the mountains, indicating an extension of this culture. The local museum at Oaxaca contains a large and instructive collection of archaeological objects from Monte Alban and other ruins in the State.

OB. A river of Siberia. See **ORI**.

O'BADIAH (Heb. 'Obadyah). The author of the fourth book of the minor prophets according to the arrangement in the Jewish canon, and the shortest book of the Old Testament. Concerning Obadiah nothing is known; it may even be that the name is a mere symbol, chosen on account of its meaning—'servant of Yahweh' (cf. Malachi, 'my messenger'). The book consists mainly of a prophecy of the destruction of Edom for abetting the destruction of Jerusalem. It must, therefore, be later than B.C. 586, and internal evidence is in favor of a period much later—during the Persian rule, if not, indeed, after the Greek conquest of Palestine. A peculiar problem in the case of Obadiah is presented by the similarity of verses 1-10 to Jer. xlix. 7-22. It appears certain that one of these passages is dependent upon the other, or that both are dependent upon a common source. Perhaps the more probable view is that Jeremiah is dependent upon Obadiah. Consult the works mentioned in the article **MINOR PROPHETS**: Caspari, *Der Prophet Obadja ausgelegt* (Leipzig, 1842); Winckler, in *Alttestamentliche Untersuchungen*, part iii. (Leipzig, 1892); Perowne, "Obadiah and Jonah," in the *Cambridge Bible for Schools and*

Colleges (Cambridge, 1882); Peters, *Die Prophetie Obadias* (Paderborn, 1892).

OBADIAH. (1) In Mrs. Centlivre's *Bold Stroke for a Wife*, one of the guardians of Anne Lovely. He is a hypocritical Quaker. (2) In Howard's farce *The Committee*, and in Knight's adaptation, *The Honest Thieves*, a brainless clerk given to drinking.

OBAN, ō'ban. A seaport and fashionable watering place in Argyllshire, Scotland, on the Bay of Oban, 20 miles northwest of Inveraray (Map: Scotland, C 3). The bay, protected by the island of Kerrera on the west, and by the high shores of the mainland, has the appearance of a lake. Oban is the great rendezvous for tourists in the west Highlands. The town owns its water supply. Population, in 1891, 4500; in 1901, 5374.

OBANDO, ō-bān'dō, José María (1797-1861). A South American general and statesman, President of Colombia. At twenty-five he joined the Republican forces; and as leader of the Liberals opposed Urdaneta when the latter became Dictator, and defeated his army at Palmira (1831). The Republic of New Granada, with a constitutional government, was formed immediately; Obando was elected Vice-President (1831-32) and then served for five years as Secretary of War. He led a rebellion against Marquez (1838-41), but was defeated and exiled until his party was restored to power in 1849. He was elected President in 1853, proclaimed himself Dictator in 1854, and was forced out of office. Obando sided with the Federalists in the Revolution of 1860 and was killed at Cruz Verde.

OBLIGATO, ōb'le-gā'tō (It., bound, compelled). A term in music signifying that the instrumental part so marked is absolutely necessary to the performance of the composition, and cannot be omitted. The word is especially applied to an instrumental accompaniment to a vocal solo.

Ó-BECSE, ō'bēch'ē. A town of Hungary. See **BECSE**.

OBEDIENCE (Lat. *obædientia*, from *obædīre*, *obedire*, to obey, from *ob*, before + *audire*, to hear). In canon law, the duty by which the various gradations in ecclesiastical organization are held subject to the several superiors placed immediately above each, respectively, in the hierarchical scale. Thus priests and inferior clergy owe canonical obedience to the bishop, and priests are bound thereto by a solemn promise administered at ordination. The bishop primitively took a similar oath to the metropolitan; but by the modern law, the jurisdiction of the metropolitan is confined to the occasions of his holding a visitation, or presiding in the provincial synod. Bishops, by the present law of the Roman Catholic Church, take an oath of obedience to the Pope. This obedience, however, is strictly limited by the canons, and is only held to bind in things consistent with the divine and natural law. In ecclesiastical history the word obedience has a special signification, and is applied to the several parties in the Church which, during the great Western schism, adhered to the rival popes. Applied to the monastic institute, obedience means the voluntary submission which all members of religious Orders vow, at the religious profession, to

their immediate superiors, of whatever grade in the Order, as well as to the superior general, and still more to the rules and constitutions of the Order. This forms, in all Orders, one of the essential vows. It is, however, expressly confined to lawful things. The name obedience is sometimes given to the written precept or other formal instrument by which a superior in a religious Order communicates to one of his subjects any special precept or instruction—as, for example, to undertake a certain office, to proceed upon a particular mission, to relinquish a certain appointment, etc. The instruction, or the instrument containing it, is called an obedience, because it is held to bind in virtue of religious obedience.

OBELISK (Lat. *obeliscus*, from Gk. *ὀβελίσκος*, *obeliskos*, spit, pointed pillar, diminutive of *ὀβελος*, *obelos*, spit, pointed pillar). A word applied to prismatic monuments of stone, terminating in a pyramidal top. In Arabic they are called *mesellah*, 'pack needle.' The ancient Egyptians called them *tekhen*, a name of unknown etymology, and stated that they were dedicated to the sun-god; they were therefore most numerous in the sacred city Heliopolis, whence most existing obelisks come. As most Egyptian gods were sooner or later identified with the sun, it eventually became appropriate to place obelisks at the entrance of every temple; even Isis had, in Ptolemaic times, two obelisks before her temple in Philæ. We first meet small private obelisks in the time of the pyramid builders; in the Fifth Dynasty some gigantic monuments, half obelisk, half pyramid, which were also dedicated to the sun-god, seem to be an attempt to develop the obelisk into larger proportions by sacrificing the monolithic principle. The pairs of obelisks flanking the entrances of temples were always monoliths, usually of granite from Syene (Assuan). From unfinished specimens in these quarries, we can form an opinion of the way in which they were roughly separated from the rock, by means of borings and moistened wooden pegs. How these gigantic monuments were, during the inundation, transported by water on rafts or specially constructed boats is depicted in a relief at Deir el-Bahri, reproduced in the *Archæological Report of the Egypt Exploration Fund* for 1895-96; unfortunately, in regard to the machinery used for erecting them, we know nothing. Judging from the difficulties experienced by mediæval and even modern engineers in transporting and erecting them, it is difficult to conceive how the ancient Egyptians, with the simple apparatus at their disposal, could handle these great blocks of a hundred and more feet in length. One of the tallest obelisks—that of Queen Hat-shepsut (Hatasu) at Karnak—is estimated at 97½ feet in length, its diameter at the base is 8½ feet, its mass is estimated at 4873 cubic feet, and its weight at 367 tons. The inscriptions state that this obelisk, together with its companion, was cut in 7, and finished in 19 months. Inscriptions mention still taller obelisks. All obelisks have four faces, and are broader at the base than at the top; the pyramidion or cap on the top is sometimes round. The pyramidion was often covered with metal (brass or gold), as were also the hieroglyphic inscriptions running down the sides of the obelisk. The pyramidion frequently contained more elaborate sculptures than the obelisk

itself. These sculptures merely represent the King engaged in worshipping and making offerings before the god; the inscriptions also are always of a very simple character, containing nothing more than the titles and praises of the dedicating King. The obelisk always stood on a cubical pedestal, slightly broader than the base of the obelisk, and on this pedestal significant ornaments were sometimes sculptured. For example, on the pedestal of an obelisk in Karnak may be seen the cynocephali worshipping the rising sun. In later times, the Romans put decorations on the top, like brazen spheres.

The earliest obelisk yet standing is that of Heliopolis (modern Matarieh), erected by User-tesen I. (the second King of the Twelfth Dynasty) before the sun-temple; another of the Twelfth Dynasty is the fallen obelisk of Begig in the Fayum. In Karnak, of two obelisks of Thothmes I., one is still standing, 76 feet high. Obelisks of Thothmes III. were specially numerous. One was removed in antiquity to Constantinople (now in the Atmeidan or Hippodrome); it is only the upper part of an obelisk originally much over 100 feet in height. Another is that of Saint John of the Lateran at Rome, now 106 to 107 feet high. The two famous 'needles of Cleopatra' were first erected by Thothmes III. at Heliopolis, and were, in Ptolemaic times, transported to Alexandria. One came thence to London in 1879 (now on the Thames embankment), the other to New York by the ship *Dessong*, at the expense of William H. Vanderbilt, in 1880 (erected in Central Park, February 22, 1881). Both these monuments were richly reornamented by Rameses II. The Paris obelisk, whose companion still stands at Luxor, dates from the time of Rameses II. It was removed in 1831 and erected in the Place de la Concorde in 1833. The Flaminian obelisk is the work of Rameses II., though his father, Seti I., commenced it. It was removed to Rome by Constantius, and in the Pontificate of Gregory XIII. it was found 16 feet under the surface of the earth. The architect Fontana reerected it under Sixtus V. with great difficulty. Of the numerous obelisks brought to Rome, that of the Monte Citorio (brought to Rome by Augustus, rediscovered in 1748) dates from the Twenty-sixth Dynasty, having been sculptured by Psammetichus II. Two obelisks in the British Museum bear inscriptions of Nekht-har-heb of the fourth century B.C.; others from the reign of Ptolemy VIII. once stood before the Temple of Philæ. These monuments were so popular at Rome that the emperors had several of them cut; for example, the Pamphilian obelisk, erected by Bernin, in 1651, in the Piazza Navona, was originally erected before the Serapeum at Rome by Domitian, whose name it bears; thence it was removed to the circus of Maxentius. The Barberini obelisk originally stood before the mausoleum (or cenotaph?) of Antinous, the favorite of Hadrian, whose death it commemorates. It was found in the circus of Aurelian in 1633, and erected on the Monte Pincio in 1822. The Sallustian obelisk and that of Beneventum belong to the same period. In modern Rome obelisks are always used as ornaments in the centre of public places, sometimes near a fountain, and often with the addition of Renaissance ornaments.

In Assyria several monuments have been found which are called obelisks, although they bear but

a slight resemblance to those of Egypt, being merely stelæ in the shape of truncated, slanting prisms, with step-shaped apices. The most remarkable is the 'black obelisk' of Shalmaneser II., covered with long inscriptions recording the victories of this King and representations of the tributes brought to him, among them the tribute-bearers of King Jehu of Israel (B.C. 842). A broken 'obelisk' of Assurnazir-pal (B.C. 885-860) is the next in importance; then one of Shamsiraman (B.C. 825-812).

See EGYPTIAN ART.

OBER, ōbēr, FREDERICK ALBION (1849—). An American traveler and author, born in Beverly, Mass. He was educated at the Massachusetts Agricultural College, and in 1872 he began his tropical explorations. He traveled in the West Indies (1876-80), making a valuable collection of birds; and visited Mexico, Spain, North Africa, and South America. He wrote travels, historical sketches, and novels, including *Camps in the Caribbees* (1879); *Travels in Mexico* (1883); *Porto Rico and Its Resources* (1892); *Josephine, Empress of the French* (1895); *History of the West Indies* (1900); and *The Cacique's Treasure Cave* (1901).

OBERAMMERGAU, ōbēr-ām'mēr-gou. A village in Upper Bavaria, Germany, noted for the celebration of the Passion Play (q.v.).

OBERDIECK, ōbēr-dēk, JOHANN GEORG KONRAD (1794-1880). A German pomologist, born at Wilkenburg. He had studied theology at Göttingen, but after a year in pastoral work devoted himself to the improvement of German orchards. He held various clerical charges, made a great collection of fruit trees, and in 1855 became editor of the *Pomologische Monatshefte*. Among his publications, the more important are: *Die Probe- oder Sortenbäume* (1844; 2d ed. 1871); *Illustriertes Handbuch der Obstkunde* (9 vols., with Lucas and Jahn, 1858-79); and *Deutschlands beste Obstsorten* (1881). Consult his *Kurzer Abriss meines Lebens* (Stuttgart, 1870).

OBERGE, ōbēr'ge, EILHARD VON. A German poet of the close of the twelfth century. Eilhard wrote, from French sources, the first German version of *Tristan and Isolde*. Of his original work there now exist a few fragments, a complete revision dating a century later, another version in prose (1484), and a Bohemian translation. Lichtenstein edited the remains of the work in German verse (Hamburg, 1877), and Pfaff the prose romance of the fifteenth century (Stuttgart, 1881).

OBERHAUSEN, ōbēr-hou'zen. An important manufacturing town in the Rhine Province, Prussia, situated near the Rhine, 40 miles north of Cologne (Map: Prussia, B 3). It has extensive iron foundries, rolling mills, railway shops, chemical works, and manufactures of various iron and tin wares, soap, porcelain, wire, glass, flour, etc. In the vicinity are important coal mines and coke ovens. Population, in 1890, 25,249; in 1900, 42,148.

OBERLÄNDER, ōbēr-län'dēr, ADOLF (1845—). A German caricaturist and painter, born at Regensburg. He studied painting in Munich at the Academy and under Piloty with fair prospect of success, as may be judged by his "Siesta" (Dresden Gallery), and "Resignation" (New Pinakothek, Munich), yet found his true field in those humorous productions of his pencil which he began in 1863 to contribute to the *Fliegende Blätter*. These soon made his name familiar in every part of the world whither that publication has made its way, and placed him among the foremost of the humorists in art. Some of the best of his work is collected in the *Oberländer-Album* (Munich, 1879-98). Consult, also: Whibley, in *Art Journal* (London, 1889); and Pratt, in *The Cosmopolitan* (New York, 1890).

OBERLEUTENS DÖRF, ōbēr-loi'tens-dōrf. A town in the Crownland of Bohemia, Austria, 32 miles south of Dresden. It has a church built in 1690 by the Archbishop of Prague, and a castle dating from 1732. Its principal manufactures are furniture, toys, hats, and woollens; some coal is mined in the region. Population, in 1900, 12,928.

O'BERLIN. A village in Lorain County, Ohio, 33 miles west by south of Cleveland; on the Lake Shore and Michigan Southern Railroad (Map: Ohio, F 3). There are no important industries; the village is noted chiefly as the seat of Oberlin College (q.v.). Settled in 1833, upon the establishment of the college, Oberlin was first incorporated in 1846. The government is vested in a mayor, elected every two years, and a unicameral council, chosen on a general ticket. The village owns and operates the water-works. Population, in 1890, 4376; in 1900, 4082.

OBERLIN, ōbār'län', JEAN FRÉDÉRIC (1740-1826). An Alsatian Lutheran clergyman and philanthropist. He was born at Strassburg, and studied at the gymnasium and university of his native place. After finishing his theological studies he was ordained to the ministry, but for several years before entering upon its work he gave private instruction in the family of a physician, from whom he acquired considerable medical knowledge. In 1766 he was appointed chaplain in the French Army, but was deterred from entering upon his duties by an appointment in the following year as pastor of Ban-de-la-Roche (Steinthal), a barren district on the borders of Alsace and Lorraine. Oberlin undertook the mission as the call of duty, and during the sixty years of his ministry wrought great changes in the character and condition of the people. His intelligence was superior, his will inflexible, his figure commanding, and in spite of opposition his courage as well as kindness finally won the day. He gave special attention to improving the material condition of the people, himself leading in the work of building roads and bridges. He introduced improved agricultural methods, sent some of the more intelligent young men to Strassburg to learn trades, and opened schools. Three Sabbaths he preached in French, the fourth in German. He created a patriarchal government in its purest form, put to practical use his knowledge of medicine, and founded a bank for lending money without interest or security. An enemy of the aristocracy and clergy, he looked with favor on the French Revolution. The Steinthal became an asylum

of refuge for many who fled to escape scenes of violence elsewhere. Outside his little canton he found admiring friends. Oberlin College (q.v.) in Ohio was named for him. His life has been written many times: by Ströber (Strassburg, 1831); Bodemann (Stuttgart, 1855; 3 ed. 1879); Hackenschmidt (Strassburg, 1902); and in English by Josephine Butler (London, 1882).

OBERLIN COLLEGE. A coeducational institution of higher learning, established in 1833 at Oberlin, Ohio, and chartered as the Oberlin Collegiate Institute. The present name was adopted in 1850. The academy or preparatory school was first opened, but in less than two years the college proper and the theological seminary were in operation. In addition, there are departments of music, drawing and painting, and physical training for women, and a summer school. Oberlin College was among the first institutions of higher learning to admit colored students and was in general a stronghold of the anti-slavery spirit. It was also a pioneer in co-education. In 1903 the faculty numbered 84, and the student enrollment was 1443, of whom 906 were women. The library contained 69,000 bound volumes and 110,000 pamphlets. The college has 16 buildings, valued with their equipment at \$765,900; an endowment of \$1,576,153, and an income of \$135,122. The total value of its property was \$2,342,102.

OBERLIN THEOLOGY. The system of doctrines taught at Oberlin College in its first period by Charles G. Finney (q.v.) and his colleagues. Finney had early come by his own thought to embrace the general system of theology taught by the leading Congregationalists of his time, and known as New School Calvinism. Although it is difficult to establish any direct connection of Finney with New Haven, it is true that the most striking similarity exists between his views and those of N. W. Taylor, even in details. The system is Calvinism modified by the doctrines of the freedom of the will and of benevolence as the constitutive principle of virtue. Sin is conceived as strictly personal to the sinner, and therefore all imputation, whether of Adam's sin or of Christ's righteousness, is denied. Original sin becomes native tendency to evil resulting in actual sin in the case of every man. Regeneration is the act of the Holy Spirit persuading the soul to the choice of the good, which choice is conversion. Great emphasis is laid upon the divine moral government, and the theory of the atonement taught is the governmental. After Finney arrived in Oberlin (1835) the theory of the simplicity of moral action (which had been taught by Emmons) was revived and made the basis of a somewhat new view of sanctification. A volition, it was said, is indivisible in its nature, and must be either right or wrong. In any moment, as having but one act of choice at that moment, the soul is, therefore, either entirely holy or entirely sinful. The ability of man to obey the law of God is complete, for his obligation cannot exceed his ability. Therefore at any moment a man may perfectly and wholly obey the law, and is therefore at that moment perfectly sanctified. If he will only continue thus to choose the right uninterruptedly (which he is able to do in consequence of the freedom of his will), he will maintain a sinless life. Since he can do

this, he ought to do it. Hence sinless perfection is both obligatory upon the Christian and possible. To attain this, the aid of the Holy Spirit was to be sought in prayer. This theory, in connection with the great practical earnestness of the Oberlin colony and their conviction of their call to effect large things in the extension of Christ's kingdom, led to efforts and professions in the attainment of holiness which were in time largely modified, but which were at first the occasion of great suspicion and opposition. A still greater occasion of antagonism was the stand taken by Oberlin in favor of the negro, and the introduction of the coeducation of women with men in the institution. The peculiarities of Oberlin were greatly exaggerated; but what peculiarities there were have largely passed away with the progress of time. Consult Finney, *Systematic Theology* (Oberlin, 1847; new ed. 1878).

OBERMÜLLNER. *ô'bër-mül'nër*, ADOLF (1833-98). An Austrian painter, born at Wels. He studied in Munich, Italy, France, and Holland, and settled in 1860 in Vienna. His splendid views from the high Alps in Bavaria, Tyrol, and Switzerland include the "Goldberg Glacier in Rauris Valley" (1874, Vienna Museum); "Mont Blanc," and "The Naasfeld near Gastein" (Linz Gallery). After sketches and drawings by Julius Payer he painted a series of twelve "Scenes at the North Pole" (1875), and in the Museum of Natural History, Vienna, he executed five mural paintings of Alpine scenery.

OBERON. In West European folklore, the king of the elves or fairies, and the husband of Titania. Oberon is first mentioned as 'Roi du royaume de la feerie' in the old French poem of *Huon de Bordeaux* (thirteenth century), which was in 1454 made the basis of a popular prose romance. This romance was translated into English by Lord Berners about 1530 (printed in 1534). From this beautiful version Shakespeare must have derived the Oberon and Titania of *A Midsummer Night's Dream*. Chaucer, Greene, and Spenser adopted Oberon. Wieland got the idea of his *Oberon* (1780) from the *Bibliothèque universelle des romans*, published in 1775. Using Wieland, Planché worked up his text for Weber's opera *Oberon*. The mediæval French poem done into modern French by Gaston Paris was edited by Guessard and Grandmaison (Paris, 1860), and Lord Berners' version by Lee for the Early English Text Society (London, 1883-85).

OBESITY, CORPULENCE, or POLYSARCIA (Lat. *obesitas*, from *obesus*, fat, p.p. of *obedere*, to eat up, from *ob*, before, near + *edere*, to eat). An abnormal deposit of fat under the skin and around the viscera. The amount of fat possessed by an individual may vary widely within the limits of health, but so long as it does not interfere with the bodily functions or movements, it is not pathological; indeed, a certain quantity is useful and necessary to protect the various organs and to maintain their temperature, as well as to serve as a reserve supply of nutrition. (See FATS.) The normal proportion of fat to the whole body weight is given as about one-fifteenth to one-twentieth. Obesity may occur at any period of life, but the tendency to corpulence is greatest after forty. In women the predisposition is greatest after the first years of child-bearing, and again after the menopause. In the pro-

duction of obesity three great causes are active as a rule. These are heredity, overindulgence in food and drink, and lack of exercise. Most persons over forty eat too much and exercise too little. Alcohol tends to fatten by substituting itself for food in the oxidizing process. Fat when once deposited favors the deposition of more fat, for by acting as a non-conducting envelope to the body it prevents the radiation of heat, and so decreases the combustion of those substances which, when not used to produce heat, are stored up as fat. The immediate cause of obesity is generally a faulty assimilation due to some digestive derangement by which oxidation of the albuminous elements of the food is interfered with. The carbohydrates are not as was long thought *directly* to blame, since they are readily converted into carbon dioxide and water. On account, however, of the ease with which the carbohydrates are oxidized, the albuminous elements of the food undergo incomplete oxidation, are not so fully decomposed, and the fat is in reality derived from them. The fatty portions of the food are not so prone to cause undue deposition of fat as are the carbohydrates, since they interfere less with the conversion of the nitrogenous elements, and are less easily oxidized.

The symptoms which may attend extreme degrees of corpulence are a falling off of mental and physical activity, shortness of breath on the least exertion, and impairment of the functions of respiration, circulation, and digestion, together with anæmia and muscular weakness. This, however, is an extreme picture. It is a matter of daily observation that obesity is compatible with a high degree of mental and physical alertness and general good health.

Many plans of treatment, based on systems of exercise and diet, have been advocated for the reduction of fat, the most notable being those of Banting, Ebstein, and Oertel. All of these systems have for their object the regulation of exercise in such a way that oxidation may proceed in a normal manner, and regulation of the diet so that a less quantity than normal of the fat-producing elements is taken in. This object is attained in various ways. In the method of Banting the total quantity of food is reduced, the liquids restricted, and the fats and carbohydrates excluded. Ebstein's method permits the use of fats, but eliminates the carbohydrates. Oertel's system is especially intended for individuals with cardiac complications, and consists of three parts. First, the reduction of liquids with promotion, by baths or other means, of perspiration; second, restriction of the diet largely to proteid substances; and third, the taking of graduated exercises in walking up hill. Cathell proposed some years ago a method which was entirely independent of diet and exercise. This was the taking, on alternate days, of Kissingen and Vichy mineral waters, with the addition, in obstinate cases, of lemon juice to the Kissingen, and aromatic ammonia to the Vichy. Thyroid extract enjoyed for a time a reputation as a fat-reducer, but its tendency to interference with the heart, which is apt to be weak in obese persons, makes it a somewhat dangerous drug. Among other substances which have been used for this purpose are iodine, bromine, mercury, lead, arsenic, lemon juice, sour wines, vinegar, Phytolacca, Gulf weed, and bladder wrack. Many

of these, while having an influence on the fat, act as slow poisons and damage the assimilative organs, so that their ultimate effect is injurious.

Obi, Obé, or Ob. The westernmost of the great rivers of Siberia (Map: Asia, G 2). It rises in the Altai Mountains, and flows northwest, then north through the Siberian governments of Tomsk and Tobolsk, emptying into the Arctic Ocean through an immense estuary, the Gulf of Obi, which is 600 miles long and 60 miles in average width. The length of the river itself above the estuary is about 2500 miles, and it is nearly two miles wide at its mouth. After emerging from the foot-hills of the Altai range the river flows for the remainder of its course through an almost perfectly level country consisting first of sandy steppes, then of rich tracts of fertile soil, and finally of vast marshes. In its lower course it divides repeatedly into parallel arms connected by cross-channels, forming a network of islands, which during floods are submerged under sheets of water many miles wide. Although not yet extensively used as a waterway, the Obi with its tributaries presents a total navigable length of over 9000 miles. In summer the main river and all its larger tributaries are navigable almost to their sources, and during the spring floods many secondary tributaries can be ascended by light-draught steamers. The river is ice-bound near its mouth from October to June. Of its numerous tributaries the largest is the Irtysh (q.v.), which is considerably longer, than the main stream from the point of confluence.

OBISPO (Sp., bishop). A Cuban name of the spotted stingray (*Aetobatus narinari*). It is one of the eagle-rays, and is brown in color, with small, round, pale spots.

O'BIT (OF. *obit*, from Lat. *obitus*, death, approach, from *obire*, to meet, from *ob*, toward + *ire*, to go). Literally, the decease of an individual. But as a certain ecclesiastical service was fixed to be celebrated on the day of death (*in die obitus*), the name can be applied to the service itself. Obit therefore signifies, in old Church language, the service performed for the departed. It consisted, in the Roman Church, of matins and lauds, followed by a mass for the dead.

OBITER DICTUM. See **DICTUM**.

OBJECT-GLASS. The lens in a telescope (q.v.) or microscope (q.v.), which is placed at the end of the tube nearest the object, and first receives the rays of light. Its function is to produce a real image of the object, and it is generally an achromatic lens.

OBJECT TEACHING. A mode of teaching in which objects are made the studies of young pupils. By this method a systematic attempt is made to exercise and train the senses of the child. Comenius (q.v.) in the *Great Didactic* writes: "Let the senses be applied to the subject as often as possible, e.g. let hearing be joined with vision and the hand with speech. It is not enough to apply to the ears, but the teacher must present to the eyes, that through them instruction may reach the imagination. Leave nothing till it has been impressed by means of the ear, the eye, the tongue, the hand." His *Orbis Pictus* was the first school-book in which pictures were used to illustrate the various topics. In the work of

Comenius, therefore, is to be found the first clear presentation of the principles of object teaching. To Pestalozzi (q.v.), however, may with justice be given the credit of introducing the method as a special feature of primary education. Since Pestalozzi all educators have agreed that the child's activity, manifested through the senses, should be directed to the things about him. In this way, (1) the child's senses are trained, (2) his judgment is aroused, and (3) he acquires a language. The three must go together. Pestalozzi saw that in order to reach clear knowledge of anything the mind must pass through a necessary sequence of processes. From sense-perception it must rise through ideation to clear concepts. Mere presentation of objects is not sufficient. There must be the inner reaction of the learner. There must be, therefore, (1) the sense-material, (2) the inner reaction of mind, (3) the word. Consult: Barnard, *Object Teaching* (New York, 1860); Calkins, *Manual of Object Teaching* (ib., 1890). See KINDERGARTEN; NATURE-STUDY; PEDAGOGY.

OBLATES, ob'lāts (ML. *oblatus*, oblate, from Lat. *oblatus*, pp. assigned to *offerre*, to offer). The name of a class of religious communities in the Roman Catholic Church, which differ from the religious Orders strictly so called in not being bound by regular vows, instead of which they make an offering (oblation) of themselves to the superior or bishop, with a promise of constancy. The principal associations of this class are: (1) The Oblates of Saint Ambrose, or of Saint Charles, whose foundation in 1578 was one of the many works undertaken in his diocese by Saint Carlo Borromeo (q.v.), Archbishop of Milan. The members were secular priests who lived in community, and were merely bound by a promise to the Archbishop to devote themselves to any service which he should consider desirable for the interest of religion. Saint Carlo made use of them chiefly in the wild and inaccessible Alpine districts of his diocese. In the suppression of small communities under Urban VIII. and Innocent X., the institution became extinct, but was revived by Archbishop Romilli of Milan in 1848. In 1856 a community on the same model was established in England by the future Cardinal Manning and his successor as Archbishop, Cardinal Vaughan, for aggressive work in London. The English oblates, whose statutes were confirmed by the Pope in 1857 and 1877, have now several houses. (2) The Oblates of Mary Immaculate was founded in 1816 by Charles Eugène de Mazenod, Bishop of Marseilles (1837-61), to repair the losses to religion caused by the French Revolution. Their rule was confirmed by Leo XII. in 1826. They were introduced into Canada in 1841 and the United States in 1848. The congregation, which has about 70 houses in all parts of the world, now numbers over a thousand members, the majority of them priests. The mother house is in Paris, in which city the great basilica of the Sacred Heart on Montmartre is principally their work.* The general is elected for life; a general chapter is held every six years. They conduct a large number of educational and charitable institutions, among them the Catholic University of Ottawa. For the life of the founder, consult Ricard, *Monseigneur de Mazenod* (Paris, 1892). (3) The Oblates of Saint Frances of Rome,

popularly known as *Donne di Tor di Specchi*. This association grew out of the charitable work of the pious woman whose name it bears, and took up its community life in 1433 in the house in Rome which it still occupies. To this house, still the only one possessed by the institute, Saint Frances went on her husband's death, and here she died as superior in 1440. The oblates are mostly ladies of noble birth, and have done much good in educational and charitable works. They, with the Jesuits, were expressly excepted from the reforming decrees of the Council of Trent affecting the regular Orders; and their statutes gave Saint Francis de Sales the idea of his Order of the Visitation. For the original foundation, consult Lady Georgiana Fullerton, *Life of Saint Frances of Rome* (London, 1855).

OBLIGATE PLANTS (from Lat. *obligare*, to bind, from *ob*, before, toward + *ligare*, to bind). Plants which can grow in but one life condition. This term, which is contrasted with facultative plants, is applied particularly to parasites and saprophytes. For example, dodder is an obligate parasite, because it has not the power to grow independently. Obligate is also used in a still more restricted sense; certain forms of dodder can grow upon only one host plant, and are, therefore, regarded as obligate in that sense.

OBLIGATION (Lat. *obligatio*, bond, from *obligare*, to bind), AT CIVIL LAW. In the widest sense legal obligation is equivalent to legal duty, but the technical meaning of the expression is much narrower. Continental jurists confine the term, in the first place, to duties toward a particular person or group of persons, excluding duties toward the State or community; in the second place, to duties assumed by or imposed upon a particular person or group of persons, excluding duties which rest upon all members of the community. Further, not all duties of particular persons to particular persons are designated as obligations; they are not so described when the duties result from some preëxisting legal relation between the parties, like marriage. Such duties have indeed been called obligations *ex re*, but this use of the word is not approved by modern writers. Finally, the term obligation is ordinarily restricted to cases where the right which corresponds to the duty imposed upon or assumed by the person obligated has economic value. Technically, then, obligations are special legal relations in which one or more persons, usually described as creditors, are entitled to claim from one or more persons, usually described as debtors, acts or forbearances which are in the economic interest of the creditors. In Roman law, and in the law of Latin countries at the present time, the word obligation is used to describe the legal relation, the duty of the debtor, and the right of the creditor. The German Imperial code has distinct terms, viz. *Schuldverhältniss*, or debt-relation; *Verbindlichkeit*, or obligation; and *Forderungsrecht*, or right of demand.

The creditor's right is a right to performance. In early law this right ran directly and exclusively against the debtor's person. Later the claim could be satisfied by seizure of goods, and ran against the person only in second instance; and execution upon the person was transformed into imprisonment for debt. Since the abolition of imprisonment for debt the creditor's claim

has become simply a claim against the goods, i.e. against the estate of the debtor. It is a right *in personam* only in this respect, that from the outset the creditor's claim runs against his debtor and no other person, while a right *in rem* runs against all the world. The duty of a person in possession of property to restore such property to its owner resembles the duty of a vendor to deliver the thing sold to the purchaser; but in the former case the duty results from the owner's right *in rem* and is not properly described as an obligation. See *IN REM*; *IN PERSONAM*.

In the Roman Imperial law the courts enforced specific performance whenever this was possible, awarding pecuniary damages also on account of the debtor's delay (*mora*). If specific performance could not be enforced, they awarded pecuniary damages, which were so measured as to put the creditor in as good a position, economically, as he would have occupied if the debtor had performed at the proper time and place. The same rules are applied in modern civil law, although some of the modern codes provide that, in case of money debts, damages shall not exceed the legal interest. The fact that the creditor's claim is, in most cases, enforceable only through the award of damages is the reason why it is usually asserted that no obligation exists unless the creditor's interest is measurable in money. Indirectly, however, an act or forbearance in which the promisee has no pecuniary interest can be secured by an agreement that the promisor shall pay a certain sum of money if he fails to do what he has promised, or does what he has promised not to do. Such 'conventional penalties' were enforced in the Roman law and are enforced at modern civil law; and although some of the modern civil codes do not require that the creditor's interest be measurable in money, claims not thus measurable can be enforced only where a decree of specific performance can be obtained from the court, or where a penalty has been stipulated.

While the obligation is thus sharply distinguished from the right to a thing, it is nevertheless true that the right of a creditor, like the right of an owner, is a property right. Like any other property right, it may be transferred or 'ceded' to a purchaser; it may be pledged or hypothecated by the creditor to his creditor; it may be attached by the creditor's creditor; in case of the bankruptcy of the creditor it passes, with his other assets, to his creditors or to those who represent and act for his creditors; and in case of the creditor's death it passes with the rest of his estate to his legal or testamentary heirs (as in English law it passes to the executors or administrators). Hence the Roman jurists, viewing property as consisting of 'things,' termed the obligation an 'incorporeal thing,' and English law operates with the same conception.

JOINT OBLIGATIONS. Where there are two or more creditors, or two or more debtors, each creditor may be entitled to sue only for his share of the claim, and each debtor may be liable only for his share of the debt. In certain cases, however, any one of the creditors may be entitled to demand full performance, and any one of the debtors may be held liable for the full debt. In such cases the obligation is said to be 'solidary,' 'actively' as regards the creditors, 'passively' as regards the debtors. The effect of performance

to one creditor is to extinguish the right of the others, and the effect of performance by one debtor is to liberate the others. All such rules, however, apply only to the relation between the creditor or creditors, and the debtor or debtors, and do not touch the relation of the joint creditors to each other, or that of the joint debtors to each other. If the joint creditors have really (i.e. equitably) a joint interest, the creditor who has received payment must satisfy the other creditors; and if the debt was really a joint debt, the debtor who has paid is entitled to hold the other debtors to 'contribution.' As between joint wrong-doers contribution is regularly excluded.

ESTABLISHMENT. Obligations, as regards their origin, were divided by the Roman jurists into four classes: (1) those established by contract (*ex contractu*); (2) those established by tort of the debtor (*ex delicto*); (3) those which resemble contractual obligation, although no contract has been concluded (*quasi ex contractu*); and (4) those which resemble obligations on tort, although the debtor himself has committed no tort (*quasi ex delicto*). The most important quasi-contractual obligations are those based on unjust enrichment and those which spring from unauthorized agency. The quasi-tortious obligations include all the cases in which a person (father, employer, etc.) is held liable for a tort which he did not commit or authorize. The classification is open to criticism, and while modern civil codes recognize obligations of the third and fourth class, they are sometimes described as 'obligations imposed by law.' This description is also open to criticism, as implying that contractual obligations are not imposed by law. In the new German code all attempt at classification is abandoned, except that contractual obligations and quasi-contractual obligations are thrown together, and that all cases of liability for illicit conduct are placed under a separate title.

EXTINCTION. Obligations are normally extinguished by performance. If the creditor sees fit to accept as performance something other or something less than he is entitled to demand, the obligation is extinguished. Tender of performance does not have the same effect; but if the obligation is to pay a sum of money or to deliver goods, the debtor is liberated by depositing the money or goods in a safe place subject to the creditor's order. Obligations are also extinguished by the substitution of new obligations (*novation*), if such was the intention of the parties. Obligations are likewise extinguished by merger (*confusion*) when the claim and the debt are united in the same person (e.g. by inheritance); by set-off (*compensation*) when a debtor, being sued, is able to put in a counterclaim; by release; and by discharge in bankruptcy proceedings.

NATURAL OBLIGATION. The Roman jurists sometimes used the term natural obligation to mean an obligation recognized by natural law (q.v.), thus including the majority of legal obligations. More technically, however, they employed the term to describe an obligation which was legally imperfect, and which could not be enforced by action at law, but which a scrupulous man would recognize and perform. To all such natural obligations they attributed at least this effect, that voluntary performance was to be regarded as performance and not as gift. Fur-

ther, money paid or property transferred under the mistaken impression that a legal obligation existed could not be recovered if a natural obligation existed. In many cases, moreover, a natural obligation was a sufficient basis for suretyship or for a new promise, and in a few cases such an obligation could be used as a set-off against a legal obligation. Modern legislators do not regard the conception with favor, but the courts have not been able to dispense with it. Consult the authorities referred to under CIVIL LAW.

OBLIQUE MOTION. See MOTION.

OBOE (It. *oboe*, from Fr. *hautbois*, Eng. *hautboy*, high wood, so called from the high notes of the instrument, from *haut*, high + *bois*, wood). The oldest and most important wood-wind instrument. It is of great antiquity and is traced in the sculpture of Egypt and Greece. The oboe is the most elaborate and difficult of reed instruments. It is made of wood, generally of box, ebony, cocoa, or rosewood, and is constructed in three pieces, or joints, forming a continuous tapering tube, about 21 inches long, the bore of which is narrow at the small end, and widens into a bell-shaped opening, one and one-half inches in diameter at the mouth. In the upper and middle piece there are holes, by stopping or opening which with the fingers the player forms the notes of the natural scale, the intermediate semitones being formed by the keys. The reed is fixed upon the end of a small brass tube which fits, socket-like, into the small end of the upper piece. The sound of the oboe is reedy and penetrating, though mild, and from its great power in swelling or diminishing the sound, it is capable of every variety of expression. In the modern orchestra two oboes are employed, the *treble oboe*, a non-transposing instrument, the music for which is written in the G clef, and the *alto-oboe* or *cor anglais* (q.v.), a transposing instrument. The principal solo compositions for the oboe are: Handel's six concertos; Mozart's quintet for oboe and strings; Beethoven's trio for two treble oboes and cor anglais; Hummel's variations, with orchestra; and Kalliwoda's concertino in F, with orchestra. The *oboe d'amore*, in use in the eighteenth century, became obsolete, but was reconstructed by M. Mahillon, of Brussels, at the order of M. Gevaert, in order to perform correctly the works of Bach. See MUSICAL INSTRUMENTS.

OBOK, ó-bók'. A seaport of French Somaliland (q.v.), situated at the western end of the Gulf of Aden (Map: Africa, J 3). It was acquired by France in 1855, and with the surrounding district formed the colony of Obok, which became the nucleus of the French possessions in Somaliland. Population, about 1000.

O'OLEI'LA (Neo-Lat., diminutive of Lat. *obolus*, from Gk. ὀβολός, *obolos*, small coin). A small fossil brachiopod of oval or rounded outline common in and very characteristic of Cambrian rocks of North America and Europe.

O'OLUS (Lat., from Gk. ὀβολός, *obolos*). The name of a Greek measure of weight and a Greek coin. Six of these oboli made a drachma. See DRACHMA.

OBRAĐOVIĆ, ó-brá'dó-vích. DOSITHEUS (1739-1811). A Servian author, the father of modern Servian literature. He was born at

Čačkovár, Hungary, and at the age of fifteen entered the Monastery of Oprovo in Syrmia. He afterwards traveled in the East and in Italy; and in 1783 he published *Život i priključenija*, or "Life and Adventures," partly autobiographic and partly fantastic. This was the first book written in the popular speech of the Servians, and made it a literary language. In Belgrade, where he settled in 1807, he was made Senator and Minister of Public Education. Besides many translations, especially of *Æsop's Fables* (1788), he wrote *Sověti zdravago razuma*, or "Wise Counsel" (1784), and a work on morals, *Sobranie nравоу-čitelnykh věšćej* (1793 and 1818). A complete edition of his works in ten volumes appeared at Belgrade (1833-45). Consult Šević, *Dositheus Obradović* (Neusatz, 1889).

OBRENOVITCH, ó-brě'n'ó-vích. A ruling family of Servia which attained power in 1817, when Milosh Obrenovitch (q.v.) was chosen Prince by the nobility and the clergy. Milosh was compelled to abdicate in 1839 and was followed by his sons, Milan, who ruled only for a few weeks, and Michael Obrenovitch (q.v.), who in turn was deposed in 1842, the power passing to the rival house of Karageorgevitch. Alexander Karageorgevitch fell in 1858 and was succeeded by the old Prince Milosh, who died in 1860 and made way a second time for his son Michael. The latter was assassinated in 1868 and Milan I. (q.v.), a grandson of Jefrem, the younger brother of Milosh Obrenovitch, was chosen Prince. He attained the kingly title in 1882, but in 1889 was forced to abdicate in favor of his son, Alexander I. (q.v.), who was assassinated in 1903, leaving no heirs. Peter Karageorgevitch was chosen King by the Skuptchina. See SERVIA.

O'BRIEN, FITZJAMES (1828-62). An Irish-American poet, story-teller, and journalist, born in Limerick. He was educated at the University of Dublin, served for a time, as is supposed, in the British Army, and squandered a considerable inheritance in London, editing a periodical in aid of the first World's Fair (1851). The next year he came to the United States. His most striking work appeared in the *Atlantic Monthly*—two short stories hardly surpassed for creative imagination in American literature. These are *The Diamond Lens* and *The Wondersmith*. He supplied the stage also with many ephemeral dramas, and with one, *A Gentleman from Ireland*, that held the boards for a generation. In the Civil War he served in the Seventh Regiment, was severely wounded, and after a lingering illness died, in Cumberland, Md. (April 6, 1862). He was a distinguished figure in the Bohemian New York of his day, and witness to the impression that he made in that sprightly circle is preserved in a sheaf of personal recollections prefixed to *The Poems and Stories of Fitzjames O'Brien*, edited by his friend William Winter (1881). O'Brien has never received full praise for his unique, if bizarre, talents, which are most clearly displayed in his stories, but are also visible in a number of poems, such as "The Skaters" and "The Wharf-Rat."

O'BRIEN, JEREMIAH (1744-1818). An American patriot, born probably at Kittery, Maine. In 1775 the captain of the British armed vessel *Margaretta* threatened to bombard the town of Machias, where O'Brien then lived, unless the

liberty pole were removed. On June 12th O'Brien and his five brothers, accompanied by about thirty-five of their townsmen, many of them armed only with pitchforks, manned a little sloop in the harbor, attacked the *Margaretta* and after a brief engagement captured her. After the battle Captain O'Brien transferred the *Margaretta's* cannon to his own vessel, which he rechristened the *Machias Liberty*, and used as a coast patrol. Later he became a privateer captain sailing under letters of marque from the colony, and while commanding the *Hannibal*, 20 guns, was captured by two British frigates and sent to England, where he was confined in the Mill Prison. After the close of the war he was appointed the first collector of the port of Machias.

O'BRIEN, LUCIUS RICHARD (1832—). A Canadian painter, born at Shanty Bay, Ontario, and educated at Upper Canada College, Toronto, where he studied architecture and civil engineering. He came to be considered the best painter in water colors that Canada has produced. As first president of the Royal Canadian Society of Artists, he furthered the interests of other artists, and Canadian art in general. His best paintings are descriptive of scenery upon the Lower Saint Lawrence.

O'BRIEN, WILLIAM (1852—). An Irish journalist and Parliamentary leader. He was educated at Cloyne Diocesan College and at Queen's College in Cork. In 1869 he became a reporter on the *Cork Daily Herald*, in 1875 he joined the staff of the *Freeman's Journal*, and in 1880 founded the *United Ireland*. Because of his political activity, he was nine times prosecuted by the law officers of the Crown and was imprisoned for more than two years. He represented the Nationalists in Parliament almost continuously from 1883 until 1895, when he retired because of dissensions in the party. In 1890 he visited the United States and collected considerable funds for the benefit of the Irish cause, and after Parnell's conviction he became one of the leaders of the anti-Parnell faction. In 1898 he originated a new agrarian movement under the name of the United Irish League, and founded the *Irish People*, as its organ. He published several books, among them *When We Were Boys* (1890) and *Irish Ideas* (1894).

O'BRIEN, WILLIAM SMITH (1803-64). An Irish politician. He was educated at Harrow School, whence he passed to Trinity College, Cambridge. He entered Parliament for the Borough of Ennis in 1828. In 1835 he was returned for the County of Limerick, and for several years strongly advocated the claims of Ireland to a strictly equal justice with England, in legislative as well as executive measures. Professing his inability to effect this in the United Legislature, and having been committed to prison in the House of Commons by the Speaker's orders for refusing to serve on committees, he withdrew from attendance in Parliament in 1841, and joined actively with Daniel O'Connell (q.v.) in the agitation for a repeal of the legislative union between England and Ireland. In the progress of that agitation, O'Brien sided with the party known as 'Young Ireland,' and when the political crisis of 1848 resulted in a recourse to arms, he took part in an attempt at rebellion in the south of Ireland. He was arrested, convicted, and sentenced to death. The sentence, however, was

commuted to transportation, for life. He was transported to Tasmania, but in 1856, in common with the other political exiles, he was permitted to return to his native country. He published *The Principles of Government* (1855). Consult: Sullivan, *New Ireland* (London, 1877); Duffy, *Young Ireland* (2d ed., ib., 1883).

OBSERVATORY (from Lat. *observare*, to observe, from *ob*, before + *servare*, to keep; connected with Skt. *sar*, Av. *har*, to protect). An institution supplied with instruments for the regular observation of astronomical, meteorological, or magnetic phenomena. In some observatories all three classes of observation are carried on, but in most cases special attention is paid to astronomy alone, and only such meteorological observations are taken as are required for the calculation of the effect of atmospheric refraction on the position of a heavenly body; there are, however, a few observatories which are devoted solely to meteorological or magnetical observations.

While observation of the heavenly bodies dates from prehistoric times and individuals at intervals made their crude observations of the heavens, the first observatory, in our modern sense of the word, was that of Alexandria, founded about B.C. 300. It continued in activity till A.D. 200; and it was here that Hipparchus discovered the precession of the equinoxes and fixed the positions of the sun, moon, and planets by means of armillary spheres (q.v.) and astrolabes, having graduated circles on which celestial latitudes and longitudes could be read off, when a pair of sights was pointed to the heavenly body. Ptolemy used a quadrant, with which he measured zenith distances on the meridian. In the ninth and tenth centuries the Arabs founded observatories at Bagdad, Damascus, and Mokattam, near Cairo. In the latter place the Hakkimite tables were constructed. In the thirteenth century the splendid observatory at Meragha, Persia, and in the fifteenth century that of Samarkand were founded by Mongol Khans. Here planetary tables and star catalogues were constructed. The first observatory in Europe was that of Nuremberg, erected in 1472, and the revival of astronomical observations in Europe dates from its foundation. In 1576 Tycho Brahe began the erection of his famous observatory on Hven, an island in the Sound. He converted the quadrant used by Ptolemy into an altazimuth by mounting it on a vertical axis in connection with a horizontal or azimuth circle. It was not till the middle of the eighteenth century that the improvement of time measurement with pendulum clocks enabled astronomers to rely for the determination of right ascensions on the times of passage across the meridian, instead of measurements with a graduated circle. The quadrant was then fixed in the meridian, and being attached to a massive wall, its dimensions were increased, and greater accuracy thereby secured in the determination of meridian zenith distances. Neither the quadrant nor the mural circle (q.v.) which succeeded it, however, could be relied upon for accurate motion in the plane of the meridian, but Römer remedied this defect by inventing the transit instrument (q.v.), which enabled astronomers to observe the times of meridian passage or transit with great accuracy, and thus to determine the right ascension of

the heavenly bodies by means of the apparent diurnal movement. With the transit and quadrant Bradley commenced that series of observations of the positions of the sun, moon, planets, and stars, which have continued ever since at Greenwich, and on which, in combination with less extensive series at Paris, Königsberg, and elsewhere, all our tables of the motions of the heavenly bodies are founded. In modern observatories the transit and mural circle have been combined into one instrument, the meridian circle (q.v.), which determines both right ascensions and declensions at a single observation.

In planning observatories a very usual mistake is an over-supply of instruments and too few astronomers. A large telescope really needs six persons to keep it busy: two astronomers, two assistants, and two computers. Moreover, the 'life' of a telescope is very short. Every few years new instruments are invented, and unless these are supplied to the observatory its astronomers will work at a disadvantage, and its astronomical output will be diminished in quantity and value.

The great observatories of the world may be divided into several classes. In the first place, we have the great Government institutions occupied with continuous observations such as are needed to strengthen our knowledge of the fundamental parts of astronomy. The Royal Observatory at Greenwich, England, is perhaps the most important of this class. It was founded by Charles II. Similar institutions are established at Paris, Berlin, Pulkova (q.v.), near Saint Petersburg, and Washington. At the last-named place the observatory is called the United States Naval Observatory (see NAVAL OBSERVATORY), and the astronomers are professors of mathematics in the United States Navy. Another class of observatories are maintained by universities and other educational institutions. These are intended to combine instruction with research, and in them an effort is usually made to extend the science of special investigations rather than by long continued routine observation. In the United States the principal observatories of this class are the Harvard University Observatory, the Lick Observatory (q.v.) of the University of California, and the Yerkes Observatory (q.v.), belonging to Chicago University. Finally, we have the very important class of astrophysical observatories, which are occupied with a study of the physics of the heavenly bodies. Probably the most important of these is at Potsdam, Germany. Much astrophysical work is also done at the university observatories of Harvard and Chicago. See TELESCOPE; MERIDIAN CIRCLE. For the lately established observatories for the observation of the variations of latitude, see LATITUDE, VARIATION OF.

OBSIDIAN (from Lat. *obsidiana*, false reading for *obsiana*, a sort of mineral, probably obsidian, from *Obsidius*, false reading for *Obsius*, name of a man who is said to have discovered it in Ethiopia). A volcanic glass consisting of silica in combination with aluminum, calcium, iron, potassium, and sodium. It is hard and brittle, with a remarkable vitreous lustre, and a perfect conchoidal fracture, the edges of the fracture, which are semi-transparent or translucent, being very sharp and cutting like glass. Obsidian is generally black or very dark gray,

but sometimes has a green, red, or brown color, is striped or spotted, and even chatoyant or aventurine. It occurs in volcanic regions, in round compact pieces, granular or fibrous. It is often found in association with pumice, which is identical with it in chemical composition, but different in structure. Pitchstone is also of similar composition, but contains a larger percentage of water and is without lustre. Obsidian is found principally in the volcanic regions of Iceland, Italy, Hungary, Spain, New Zealand, Siberia, Mexico, Peru, and the western parts of the United States, especially in Georgetown, Col., and at the Obsidian Cliff in the Yellowstone Park, where it occurs in massive form. The famous locality in Mexico is the Cerro de Navajas, or 'Hill of Knives,' in the State of Michoacan. Obsidian takes a high polish, but is very brittle. Nevertheless, it was extensively used among primitive peoples for arrowheads and spearheads, for knives, mirrors, polished figures, and ornaments, the best specimens of which have been found in Mexico. The early Romans obtained obsidian mirrors from Ethiopia. The mineral is still sometimes employed as material for ornamental boxes, buttons, and other articles.

OBSTETRICAL TOAD. See MIDWIFE FROG.

OBSTETRICS (from Lat. *obstetricius*, relating to a midwife, from *obstetrix*, midwife, form *obstare*, to stand before, from *ob*, before, toward + *stare*, to stand), MIDWIFERY, or TOKOLOGY. That branch of medicine which is concerned with the care of women during pregnancy, and during and after labor, whether natural or irregular, with the diseases peculiar to the puerperal state, and with the care of the new-born child. It also embraces a knowledge of the anatomy of the female generative organs and the physiology of reproduction in the human species. While among savages little or no assistance is given to the parturient woman, and the process is left to unaided nature, among civilized peoples from the earliest times there has been a class of persons—usually women—who have attended women during this trying period. The Jews had women (called *mejel-edeth*) who acted as midwives, as did the Egyptians; and among the Greeks there was a corresponding class of women known as *mæeutriæ*. Phanarete, the mother of Socrates, was a midwife; and Plato explains the duties undertaken by these women. Hippocrates gave considerable attention to midwifery, and describes the operation of turning the child in abnormal labors. Among the Romans both physicians and midwives (*obstetrices*) attended confinements. Cæsarian section was performed after the death of the mother, and Pliny mentions that Scipio Africanus and Manlius were born in this way. There was a royal law (*lex regia*) providing for the performance of this operation when necessary. Celsus and Paulus of Ephesus wrote of obstetrics during the first century, and a gradual increase in the knowledge of the physiology and mechanism of labor can be traced in the writings of Galen (second century), Actius (fifth century), and Paulus Ægineta (seventh century). The latter advocated the operation of craniotomy in suitable cases. During the Middle Ages there was little progress in obstetric science in Europe, but the Arabian and Persian schools made many improvements in this branch of medicine as well

OBSERVATORY

THE YERKES OBSERVATORY OF THE UNIVERSITY OF CHICAGO, AT LAKE GENEVA, WISCONSIN

as in others. Midwives did most of the work, but physicians were called in abnormal cases. Rhazes of Bagdad (A.D. 800) first advised artificial rupture of the membranes when spontaneous rupture was unduly delayed; and Avicenna of Ispahan (A.D. 900) described an instrument somewhat like the modern forceps. The teachings of these two physicians became celebrated throughout Europe and the East, and were followed for many years. With the revival of learning the science of midwifery began to receive the attention of the most famous physicians. Vesalius (q.v.) in 1543 first correctly described the bony pelvis, and Levret in France (1754) and Smellie in England (1751) completed his work 200 years later by taking exact measurements of the several diameters of the pelvic cavity.

At the commencement of the sixteenth century Eucharius Rhodion published a little book which is remarkable as being the first book published on this subject in England. In 1573 Ambrose Paré published a small work in which he showed that foot-presentations were not dangerous, and that in mal-presentations it was better to deliver by the feet than to attempt to bring down the head. Guillemeau and Mauriceau, his successors, developed and improved his teachings. About 1640 Dr. Paul Chamberlin, an Englishman, invented the forceps with separate blades, such as are now used. The Chamberlins (father and sons) did not publish their discovery, and it was not until 1815 that the exact nature of the instrument became known. The first scientific book on midwifery was published in 1513 by Eucharius Rösslin; and Justine Siegemund, a court midwife of Brandenburg, attained celebrity by her work on this subject. In 1668 Mauriceau's *Treatise* appeared, and was for a long time the standard work on the subject. A point requiring notice in the history of midwifery in the seventeenth century is the discovery of the use of ergot of rye in accelerating parturition. In 1688 Camerarius stated that midwives in some parts of Germany were in the habit of employing it for this purpose; but it is not till 1774 that we find any further reference to the use of this drug. Important contributions to obstetric knowledge during the eighteenth century were made by Smellie and Ould (1742) in England, who described the engagement of the foetal head in the pelvis; Levret (1747), Solayrés de Renhac (1771), Baudeloque (1781), and Madame Lachapelle (1795) in France; and Boer and Schmitt in Germany. The first, however, to give a clear and correct explanation of the entire mechanism of labor was Naegele the elder (1819), who may be considered the founder of modern obstetric science. In the nineteenth century many notable improvements in the art of midwifery were made; among them may be mentioned the induction of premature labor (first in England about 1756; in Germany in 1804; in France 1831); the use of auscultation to detect the foetal heart-beat; the perfection of the obstetric forceps, and its more frequent use in place of craniotomy; and the employment of general anæsthesia in both normal and complicated labors. Partial anæsthesia by the injection of cocaine into the spinal canal in the lumbar region has been introduced within a few years to take the place of general anæsthetics when these have been contra-indicated. Obstetrics is now an important part of

the curriculum of medical schools, and lying-in hospitals in connection with these schools have been established. Vienna has long been recognized as the centre of obstetrical teaching, the hospital in that city confining about 10,000 women annually. Good schools are also to be found in Paris, Berlin, Dublin, and New York. The latter city, on account of its large foreign population, affords unusual clinical advantages. On the Continent and to a less extent in Great Britain, regularly licensed midwives are still extensively employed, but in the United States and among the better classes of Great Britain confinements are intrusted exclusively to physicians.

The science of midwifery may be considered under three main divisions: the anatomy of the female generative organs; the physiology of these organs during the process of reproduction; and the pathological conditions which may arise during this period.

ANATOMY. The generative organs of the female consist of the uterus; the two ovaries, connected with the uterus on either side by the Fallopian tubes, which open into its cavity; and the vagina, or canal leading from the uterus to the external parts. The breasts are also included, although only active after the birth of the child.

PHYSIOLOGY. Reproductive activity, including the functions of menstruation, conception, gestation, parturition, and lactation, is limited in the female to a period of life beginning at about the twelfth year and ending about the forty-fifth. These limits vary by a few years, according to climate, an earlier maturity being characteristic of hot countries. When conception has taken place, the impregnated ovum makes its way through one of the Fallopian tubes to the cavity of the uterus, where it lodges and develops through the agency of a convoluted mass of blood vessels called the placenta, from which a cord of vessels (the umbilical cord) runs to the abdomen of the fœtus. The duration of normal pregnancy varies from 275 to 280 days (nine calendar or ten lunar months), but gestation may be prolonged beyond this time in very rare cases to 300 or 306 days. Pregnancy is terminated with the expulsion of the child by the contractions (labor pains) of the powerful muscular fibres of the uterus. The more important signs and symptoms of pregnancy are the perception of the foetal heart-beats by the ear (auscultation); 'quickening,' or active movements of the child *in utero*; passive movements (ballotement) elicited by manipulation; suppression of the menses, morning nausea, gradual enlargement of the abdomen and breasts, and pigmentation of the area immediately surrounding the nipple. Of these only the first three can be considered certain indications of pregnancy, the existence of which can rarely be diagnosed with precision before the third month. During gestation the fœtus floats freely in a sac of water called the amniotic fluid, and changes its position frequently. When parturition begins, however, the long axis of the fœtus usually coincides with that of the mother, with the head downward, or *presenting* at the pelvic outlet. This is by far the most common presentation, occurring in about 96 per cent. of all cases. In about 3 per cent. the buttocks or feet present. About once in 200 labors what is known as a transverse presentation is met with (that is, the long axis of the

child is at right angles to that of the mother). Delivery being impossible in this position, artificial correction of the presentation, usually by turning and bringing down the feet, must be resorted to. Labor is arbitrarily divided into three stages: The first stage begins with the earliest premonitory pains and ends with the complete dilatation of the uterine outlet; this stage may last several hours or even days. During the second stage the bag of water ruptures, the uterine contractions become stronger, and the child passes through the parturient canal and is born. This event completes the second stage. The third stage ends with the expulsion of the placenta and fetal membrane, and lasts usually about half an hour. The duration of labor in first confinements is on an average about twelve hours; in succeeding labors, six to eight hours; although much longer periods are not dangerous or uncommon. The puerperal or lying-in state begins at the completion of labor and lasts about six weeks. During this time lactation is inaugurated and the uterus gradually resumes its wonted size and shape (involution). The length of the lying-in period varies in different countries and races; among uncivilized people and in parts of the East the mother resumes her usual occupations immediately after parturition; but in civilized countries the woman is confined to her bed for a week or ten days.

THE PATHOLOGY OF PREGNANCY. While the pregnant woman is liable to disease equally with other individuals, there are certain disorders which are peculiarly apt to arise during gestation, or are dependent on it. The teeth may undergo decay, owing to the fact that the mineral elements necessary for their nutrition are appropriated by the embryo. Constipation from both mechanical and sympathetic causes is a common disorder. The kidneys, owing to the increased functional activity demanded of them, not infrequently become diseased, as evidenced by the appearance of albumen in the urine. These organs failing in their function, poisonous products of metabolism accumulate in the blood, pronounced nervous symptoms, such as headaches, vomiting, and impairment of sight and hearing, appear, and if not relieved, uræmic convulsions (the so-called eclampsia) are induced, ending often in coma and death. Besides these and many other affections incident to pregnancy, there are certain chronic diseases which, by reason of the increased strain upon the vitality at this time, are likely to prove fatal. The heart normally undergoes a measure of hypertrophy in pregnant women in order to meet the increased demands of circulation. When, however, there exists chronic disease either of the substance or the valves of this organ, it may prove unequal to the strain. The danger from this condition increases with each succeeding pregnancy. When pulmonary phthisis exists in the mother, gestation in the majority of cases accelerates the progress of the disease.

Pregnancy may be terminated at any time before the normal period of 280 days. When this occurs during the first six months, it is called abortion or miscarriage; when it happens during the three succeeding months, it is termed premature delivery. A fœtus born before the fifth month does not ordinarily survive. Abortion is always a serious accident, either from loss

of blood, or blood poisoning and peritonitis. This is particularly the case in forcible or criminal abortion, in which the mortality is very high. Extra-uterine (ectopic, tubal, or abdominal) pregnancy occurs when the impregnated ovum fails to reach the interior of the uterus and lodges in the Fallopian tube or drops into the abdominal cavity. The fœtus develops in this situation, and unless the condition is recognized early and operated upon, death is likely to occur during the third or fourth month from rupture of the tube, hemorrhage, and peritonitis. A similar condition of affairs takes place in what is termed 'missed labor' when the fœtus fails to be expelled at term. Operation for tubal pregnancy was advocated by Tait, Veit, Mundé, and others, and is now a common procedure.

The progress of natural labor may be obstructed by certain conditions of the mother and child. In the former, deformities of the bony pelvis, disease of the uterus resulting in rupture, and malposition of the placenta (placenta previa) are the most important. The child may be too large, or ill-formed, or present abnormally. These abnormal conditions render necessary various obstetric operations. Among these are: the induction of abortion or premature labor, when the mother's life is in danger, or the size or shape of the bony pelvis is such as to preclude delivery at full term; the extraction of the child with forceps; the Cæsarian operation (delivering the child through an opening in the abdomen); version or turning when the fœtus presents abnormally or labor needs to be rapidly completed; and perforation of the head (craniotomy). The chief danger to which the woman is liable after delivery is puerperal or child-bed fever, which is now known to be simply septicæmia (q.v.) or blood poisoning, due to infection from unclean hands, instruments, or appliances. Since the discovery of antiseptics, child-bed fever has been constantly on the decline, and at the present day is a comparatively infrequent complication, both in hospitals and private practice. See PHLEGMASIA ALBA DOLENS.

OBVERSION (from Lat. *obvertere*, to turn toward or against, from *ob*, before, toward + *vertere*, to turn). In logic, the process of transforming a judgment into one of opposite quality, i.e. affirmative into negative, and vice versa. The change may be effected provided due compensation is made by changing the quality of the predicate. E.g. 'All men are mortal' becomes by obversion 'No man is immortal.'

OCALA, ô-kä'lä. A city and the county-seat of Marion County, Fla., 101 miles south by west of Jacksonville; on the Plant System and the Florida Central and Peninsular railroads (Map: Florida, F 2). Emerson Memorial Home and School, a Methodist Episcopal institution for colored girls, is located here. Ocala is surrounded by one of the most productive sections of the State—a region interested largely in the cultivation of oranges and vegetables. It is the centre of extensive phosphate interests. There is a public market; and the electric light plant also is owned by the municipality. Population, in 1890, 2904; in 1900, 3380.

O'CALLAGHAN, ô-käl'ä-han, EDMUND BAILEY (1797-1880). An American historical scholar

and editor. He was born in Ireland, and was educated in medicine in Paris. He removed to Canada in 1823. Then he became interested in the Irish national movement, was one of the organizers of the Society of the Friends of Ireland, and editor of its organ, *The Vindicator*. In 1836 he was elected to the Provincial Parliament. In the year following he took a leading part in the Canadian insurrection (1837), and on the failure of the movement fled to the United States. Resuming practice in Albany, N. Y., he became greatly interested in the records of colonial New York, and it was largely through his efforts that the work of publishing them was undertaken. His published works include: *History of New Netherlands* (1846); *Documentary History of the State of New York* (4 vols., 1849-51); and *Documents Relating to the Colonial History of New York* (11 vols., 1855-61). The two latter series were edited by him with introductions and elaborate and careful notes.

O'CALLAGHAN, JOHN CORNELIUS. (1805-83). An Irish historian, born in Dublin. He was educated for the law, but went into journalism. His chief claim to remembrance rests upon his editorial work in the secret history of the revolution in Ireland in 1888-91, written by Charles O'Kelly, an officer in the service of James II., which was published under the title *Macariz Excidium* (1846), and upon his *History of the Irish Brigades in the Service of France, from the Revolution in Great Britain and Ireland under James II. to the Revolution in France under Louis XVI.* (1869).

OCAÑA, ó-kán'yá. A town of the Department of Santander, Colombia, 235 miles north of Bogotá, on the upper courses of the Taira River. The town is situated in the midst of a fertile plain noted for its production of coffee, and in addition is the centre of a brisk trade between Western Venezuela and the Magdalena Valley in anise and hides. In the vicinity are deposits of coal and lead. Ocaña was founded in 1572. Its population is about 6200.

OCARINA, ók'á-rě'ná (It., diminutive of *oca*, goose; so called from its resemblance to a goose-egg). A musical instrument of Tyrolean or Austrian origin, improved by French musicians. The ancient prototype of the ocarina is the Chinese *hsian*, which was invented about 3000 B.C. The modern instrument was at first a molded piece of clay a few inches long, with holes for keys, a mouthpiece, and hollowed within. Five different sizes are now made for the different parts in music, and a piston at the end is used to temper the note. A row of keys in the improved instrument takes the place of the original holes.

O'CAROLAN, ó-kár'ó-lan, TURLOOH (1670-1738). An Irish bard, and one of the last of his calling, born in Newtown, Meath. He was blind from the age of sixteen, and spent his life wandering through Ireland, singing to the accompaniment of his harp. Many of his songs, all of which were vigorously national in character, are still to be heard in parts of Ireland. A collection of his ballads was published during the eighteenth century, but others of them have been handed down by tradition among the peasantry. He died in Roscommon.

OC'CAM, WILLIAM OF, or WILLIAM OCKHAM (?-1349). A famous schoolman, surnamed *doctor singularis et invincibilis*. Little is known of his early life. There is some reason to believe that he was born at the village of Ockham in Surrey, England. He took the degree of B.D. at Oxford and afterwards studied in Paris. He was a Franciscan, and about 1321 became involved in a controversy which arose in his Order concerning the question whether Jesus and the Apostles owned property. A certain Narbonne priest affirmed that the founders of the Christian religion had all things in common, and the doctrine was vigorously supported by William of Occam and other influential Franciscans, notwithstanding its condemnation by the Pope, John XXII. In 1328 Occam and the others, fearing for their safety at Avignon, fled from that city and made their way to Munich, where they were received and protected by Louis, Holy Roman Emperor. The remainder of Occam's life was passed in that city, where he continued his dispute with the popes and labored to perfect his system of philosophy. Whether he ultimately became reconciled with the head of the Church is disputed. He died at the convent of his Order in Munich in 1349 or shortly after that year. Occam's most important work was done in the field of logic and philosophy. His system is commonly classed as nominalism (q.v.), which had never before received so vigorously logical and rational a treatment. Occam's chief works upon logic were the *Summa Logices* and *Expositio Aurea Super Totam Artem Veterem*. On philosophy and theology he wrote *Questiones* and *Summulae in Octo Libros Physicorum*; *De Sacramento Altaris*; *De Corpore Christi*; *Questiones in Quatuor Libros Sententiarum*, based on Peter Lombard's *Sententiae*, and containing nearly the entire theology of Occam. His polemical writings against the Pope include the *Opus Nona-ginta Dierum*; *De Dogmatibus Papae Johannis XXII.*; *Compendium Errorum Papae*; *Defensorium Contra Johannem Papam*; and *Dialogus in Tres Partes Distinctus, Quarum Prima de Haereticis, Secunda de Erroribus Johannis XXII., Tertia de Potestate Papae, Conciliorum, et Imperatoris*. Consult: Ueberweg, *History of Philosophy* (Eng. trans., London, 1872-74), and the article "Ockam" in Herzog's *Realencyclopädie*.

OCCANEE'CHI. An eastern tribe of Siouan stock, living, when first noted in history in 1670, in southern Virginia, having their chief town upon an island called by their name, at the confluence of the Staunton and Dan rivers, just above the present Clarksville. The principal trading paths between the northern and southern tribes of Virginia and the Carolinas crossed at this point, which fact made their language the general trade language throughout the region, while their town contained always a considerable reserve store of corn and skins. In 1676 they aided the Virginians against the invading northern Indians, but were repaid by being attacked in turn by the whites, determined to plunder the town. The Occaneechi repelled the attack, but with such heavy loss that they soon after abandoned their island settlement and retired southward into Carolina. In 1701 they were found living at the Occaneechi hills, about the present Hillsboro, N. C., but evidently declining, and shortly afterwards they united with the Saponi.

Tutele, and one or two other broken tribes. Consult Mooney, *Siouan Tribes of the East*.

OCCASIONALISM (from *occasional*, ML. *occasionalis*, relating to occasion, from Lat. *occasio*, opportunity, cause, occasion, from *occidere*, to fall, perish, set, from *ob*, before, toward + *cadere*, to fall, Skt. *sad*, to fall). The name given to the philosophical system devised by the school of Descartes (q.v.) for the purpose of explaining the interrelation between mind and matter. It is a palpable fact that certain actions or modifications of the body are preceded, accompanied, or followed by corresponding acts of mind, and vice versa. This fact, although it presents no difficulty to the popular conception, according to which each is supposed to act directly upon the other—body upon mind, and mind upon body—has long furnished to philosophers a subject of much speculation because, accepting the erroneous principle that cause and effect must be similar, they could not conceive the possibility of any direct mutual interaction of substances so dissimilar as mind and body. And more than one system has been devised for the explanation of the problem. According to the occasionalists, the action of the mind is not, and cannot be, the cause of the corresponding action of the body. But they hold that whenever any action of the mind takes place, God directly produces, in connection with it and by reason of it, a corresponding action of the body, and conversely. This simply pushed the difficulty a step further back. If mind cannot act upon matter, then God, conceived as mind, cannot act upon matter; but, conceived as other than mind, cannot act upon mind. See GEULINCKX, the leading occasionalist; PREESTABLISHED HARMONY.

OCCLEVE, ðk'klév, THOMAS. An early English poet and man of law. See HOCCEVE, THOMAS.

OCCCLUSION (from Lat. *occludere*, to shut up, from *ob*, before, toward + *cludere*, to shut; probably connected with OHG. *sliozan*, Ger. *schliessen*, to close, provincial Eng. *clot*, bolt, and with Gk. *κλειν*, *klaiein*, to close). A special case of absorption (q.v.). The word is used to express the fact that gases are absorbed by solids. Sometimes it is a true solution, as in the case of hydrogen and palladium, carbon dioxide, cast iron, etc.; other times it is a condensation on the surface or within the pores, as in the case of charcoal and ammonia or oxygen.

OCCOM, ðk'om, or **OCCUM**, SAM(P)SON (c.1723-92). An American Indian preacher and missionary. He was born at Mohegan, Conn., and was converted during the religious revivals of 1739-40. He acquired some ability to read, and, desiring to serve as missionary to his tribe, at the age of nineteen entered an Indian school kept by Rev. Eleazar Wheelock of Lebanon. After four years' study he opened a school at New London, but later went to Montauk, L. I., and taught among the Indians for ten years. He became a member of the Suffolk Presbytery in 1759. In 1765-66 he went to England with the Rev. Nathaniel Whitaker to raise funds for Moor's Indian charity school, and while there preached in many parts of England, and secured nearly £10,000. The school thus reënforced was subsequently transferred to New Hampshire and became the nucleus of Dartmouth College. The

latter part of his life was occupied mainly with missionary work among the Indians of central New York. He died at New Stockbridge, N. Y. For his account of the Montauk Indians, consult the *Massachusetts Historical Society's Collections*, first series, vol. x. He published a hymn-book (1774). The hymn "Awaked by Sinai's awful sound" is attributed to him.

OCCULTATION (Lat. *occultatio*, concealment, from *occulare*, to conceal, from *occulere*, to cover, from *ob*, before, toward + *calere*, connected with *celare*, to hide). A term used in astronomy. When the moon, in the course of her orbital motion around the earth, passes between us and a star or planet, the latter is said to be *occulted*. The phenomenon is thus quite analogous to eclipses. Observations of the exact instant when occultations occur were formerly used to determine the longitudes of places on the earth. But this is now done more accurately by telegraphing time signals, and the principal use of modern occultation observations is to determine the angular diameter of the moon. This is done by observing the exact times when certain stars disappear behind the moon, and also the exact moments when the same stars reappear again. From these observed data, we can determine the moon's angular diameter by a process of calculation. See ECLIPSE.

OCCULTISM (from *occult*, from Lat. *occultus*, hidden, p.p. of *occulere*, to conceal). An 'occult' property of matter is, in mediæval phraseology, a property that requires to be made manifest by experimentation; and occult science is simply experimental science. The term has undergone a curious transformation of meaning. As such science was the occupation of the few, and was not seldom suspect to the reigning theology, the word 'occult' gradually assumed the significance that it now possesses, of something magical or uncanny or supernatural. See MAGIC; SPIRITUALISM; THEOSOPHY.

OCCUPANCY (from Lat. *occupare*, to occupy, from *ob*, before, toward + *capere*, to take). A mode of acquiring title to property by taking possession of an unappropriated corporeal thing with the intention of becoming its owner. This mode of acquiring property came into the common law from the Roman civil law, which considered occupancy a mode of acquiring property belonging to no one, but subject to appropriation by the first comer. The finder of unclaimed lost goods has a title to them by occupancy. So has the captor of beasts of a wild nature so long as he keeps possession of them, but there can be no complete property in them till they are domesticated; and if they make their escape, with no intention of coming back, the ownership of the original owner ceases, and their next captor acquires a title in them by occupancy. But if they be once domesticated the title by occupation becomes indefeasible. The owner of property by accession acquires his title by occupancy, and so does the owner of goods obtained by confusion; it being held that where a person with fraudulent intent mixes his property indistinguishably with that of another, the latter is not compelled to distinguish his property from that of the former, but is entitled to the ownership of the whole. (See ACCESSION; CONFUSION.) Blackstone refers the title to literary property to the head of occupancy, and here also belongs the title to trade-

marks, which is acquired by a person using such marks to indicate his ownership of certain articles, or of certain business.

The acquisition of title to land by occupancy is also recognized by the law. Land left bare by the gradual action of the sea, or deposited by a river, is acquired by occupancy. While this country was a colony of Great Britain, the ownership of land was held to be vested in the Crown, and individual titles to land were derived from the Crown. Since the separation of the colonies from Great Britain, titles are derived from the grant of the United States or the individual States. The right of the discoverer of uninhabited lands to assume jurisdiction over them is to be referred to the same general principle of title by occupancy. See **REAL PROPERTY; TITLE;** and consult the authorities there given.

OCCUPATION NEUROSIS. A nervous condition characterized by a partial paralysis due to excessive fatigue of a set of muscles which have been constantly used by a neurasthenic; musculature. Among occupation neuroses are chorea scriptorum, or writer's cramp, telegrapher's cramp, etc. For discussion of these diseases, see **NEUROSIS.**

OCEAN (OF. *ocean*, Fr. *océan*, from Lat. *oceanus*, from Gk. *Ὠκεανός*, *ōkeanos*, ocean; connected with Skt. *āsanya*, ocean, from *ā*, toward + *śi*, to lie). The great expanse of salt water occupying the larger depressions of the earth's surface. With the rivers and lakes it constitutes the water envelope or hydrosphere between the gaseous atmosphere and the solid lithosphere. Continental lands lie mostly in one hemisphere and may be regarded as large islands and peninsulas, while the ocean is a continuous water body communicating throughout its entire area. The relative proportion between the land and water surfaces has not been accurately determined, as there are still large unexplored areas in the Arctic and Antarctic regions; but, using the proportion for the known parts of the earth, it is estimated that the ocean covers 72 per cent. of the entire surface, or approximately 142,000,000 square miles. With an estimated average depth of two miles the ocean's volume is 284,000,000 cubic miles, or $\frac{7}{11}$ of the earth's volume.

DIVISIONS OF THE OCEAN. The continents which are massed as great triangles within the hemisphere having Southern England for its pole separate the included portion of the hydrosphere into three broad arms—the Atlantic Ocean, between America and Europe-Africa; the Pacific Ocean, between America and Asia-Australia; and the Indian Ocean, between Asia-Australia and Africa. Of these the Atlantic and Pacific communicate at their northern extremities through the Arctic Sea, which may be regarded as an extension of the Atlantic basin. The three oceans are further divided into northern and southern parts by the equator, but this division is conventional and not based upon physical grounds. Southward, beyond the limits of the continents, they open out into a vast expanse of shoreless water to which the name Southern Ocean may be conveniently given, the Antarctic Ocean being restricted to the area within the Antarctic Circle.

The borders of the ocean are often partially shut in by chains of islands, or they form deep re-

entrants into the continental lands, and such portions may have distinctive physical features. The mediterraneans, illustrated by the classic Mediterranean and the Gulf of Mexico, are inclosed seas, communicating with the ocean only by narrow passages; their depths range from 1000 to 2000 fathoms and over limited areas even exceed the latter figure. Marginal or fringing seas, partially inclosed by island groups, include waters of great depth like the Yellow Sea and the Japan Sea, and shallower bodies like the North Sea. Deep reentrants on continental borders with broad openings toward the main ocean are illustrated by the Bay of Biscay and the Gulf of Guinea.

THE OCEAN FLOOR. The ocean basins are vast depressions, whose surface rises and falls in gentle undulations. Throughout most of its extent the bottom lies at depths exceeding 2000 fathoms, and there are many depressions or 'deeps' lying below 3000 fathoms. The greatest depth yet reported is 5269 fathoms, or 31,614 feet, in the Pacific near the island of Guam. Soundings of 5155 fathoms and 5147 fathoms have been obtained in the same ocean, while the greatest known depth of the Atlantic is 4561 fathoms off the coast of Porto Rico. In the deeper or pelagic regions the floor consists of soft oozes, formed from the calcareous shells of minute animals living near the ocean surface, and from volcanic dust. The most widespread deposit is globigerina ooze, an accumulation of fossil casts of foraminifera. When the depths exceed 2500 fathoms, however, the calcareous shells are dissolved by the water and there remain only the siliceous remnants and volcanic materials which accumulate very slowly over the floor as red clay. On the borders of the continents, the ocean sometimes overlaps the land in a broad belt of shallow water whose floor is commonly called the continental shelf; here the depths do not often exceed 100 fathoms for considerable distances off shore, and the bottom consists of sand and clays that have been derived from the adjacent land surface by the erosive and transporting action of rivers. The littoral islands are mostly located on such platforms, which are prominent on the eastern coast of America, the western coast of Europe, and the southwestern coast of Asia. The deeper ocean is almost free from large islands, although by volcanic activity many small islands have been built up from great depths, as in the South Pacific. See **DEEP-SEA EXPLORATION.**

OCEAN WATER. By the continuous process of interchange between the surface waters of the land and the ocean, the latter has become a depository of vast quantities of mineral matter that have been dissolved out of rocks through the agency of springs and streams. The principal constituents of sea-water are the more soluble salts—the chlorides and sulphates of the alkalies and alkaline earths. The less easily soluble compounds, although playing a much more important rôle in the formation of rocks, are present in sea-water in only minute quantities. On the average 100 parts of water contain 3.5 parts of solid materials whose composition is about as follows: Sodium chloride, 77.76 per cent.; magnesium chloride, 10.88 per cent.; magnesium sulphate, 4.74 per cent.; calcium sulphate, 3.60 per cent.; potassium sulphate, 2.46 per cent.; magnesium

bromide, 0.22 per cent.; and calcium carbonate, 0.34 per cent. Small amounts of various other substances, including silicon, phosphorus, fluorine, iodine, boron, aluminum, barium, strontium, manganese, iron, copper, nickel, lead, and even of the much rarer metals, gold and silver, are also known to be present. The slight portion of dissolved calcium carbonate is of great importance to marine life, being the source from which the corals and shell-building organisms derive their supplies of lime. The amount of salts dissolved in the water varies in different localities, though the range of such variation is small. In regions of heavy rainfall, such as the equatorial calms and off the mouths of large rivers, the salinity is lowered, as it is also in high latitudes, where evaporation takes place slowly. On the other hand, the waters of inclosed seas, like the Red Sea and the Mediterranean, and of trade-wind belts which receive little precipitation and are subject to rapid evaporation, are slightly above the average in salinity.

The freezing point for sea-water of average salinity is 28° F., which is also the point of maximum density, while fresh water attains its greatest density at 39° F. As the surface of the ocean is cooled its density increases steadily, so that the upper layers by sinking distribute the low temperature throughout the mass. Owing to the ocean currents which tend to equalize the temperatures and to chemical changes which lower the freezing point, the ocean, however, never freezes solid even in the coldest regions. Its surface waters show a smaller range of temperature than does the air over it and much smaller than the land in the same latitudes. This tendency to preserve an equable temperature has great influence upon the climate, especially as it tempers the winds which blow over its surface. In the polar regions when the surface waters are freezing, the minimum temperature is somewhat less than 30°, while the waters of the Red Sea attain a maximum of more than 90°, showing an extreme range between the warmest and the coldest parts of over 60° F. The greatest annual variation in any one locality is probably off the coast of Newfoundland, a region affected at different seasons by cold currents from the north and by warm currents from the tropics. With depth there is a rapid decrease in temperature (more rapid in regions near the equator) until a depth of about 400 fathoms is reached, when there is a very gradual lowering to the bottom, where the temperature remains practically uniform at from 32° to 35° and is independent of latitude. In inclosed seas shut off from communication with the deeper parts of the ocean by shallow barriers, the temperature corresponds to that of the ocean only in the upper portions above the level of the barrier; below this depth the temperature remains constant to the bottom and is determined by the coldest surface waters in winter or by the influx of waters at the deepest inlet. Thus the Mediterranean shows a uniform temperature of 55° below 190 fathoms (the depth of the Strait of Gibraltar) to the bottom in 2400 fathoms, while the Atlantic at the latter depth has a temperature of 35°. The Gulf of Mexico and the Caribbean Sea, with inlets 700 fathoms deep, have bottom temperatures of 39°, and the Red Sea below 200 fathoms, which is the extreme depth of the Strait of Bab-el Mandeb, has

a temperature of 70°. The abnormally high temperature of the Red Sea is due to the concentration of its surface waters by evaporation, causing them to sink and thus to maintain a constant vertical circulation.

The average density of sea-water is 1.026, there being a slight variation corresponding to the difference in salinity. Between the surface and great depths the density shows no material change, notwithstanding the enormous pressure exerted upon the lower layers. The color of pure ocean water, examined by transmitted white light, is pale blue, but becomes a deep blue, changing to sky-blue, when it reflects the light of the clear sky, and to gray or almost black under heavy storm clouds. Along the shore, however, it may assume a brown or yellowish color from suspended mud, while in shallow portions or near the coast it is green. Minute vegetable and animal organisms sometimes lend a whitish or reddish color to the surface.

MOVEMENTS OF OCEAN WATERS. The surface waters of the ocean are in constant motion under the influence of waves, tides, currents, and drifts. Waves are vertical oscillations caused by the winds, and have little movement of translation except in shallow water when the upper portions rush forward with great force. Great waves caused by earthquakes move across the oceans. (See EARTHQUAKE.) Tides resemble waves in their motion, but they owe their origin to the attractive force of the sun and moon. (See TIDES.) The horizontal movements of the surface waters are known as drifts and currents. A drift is a general movement under the influence of the wind, but slower and more changeable in direction than a current. (See OCEAN CURRENTS.) Inclosed seas also have circulatory movements, usually arising from the fact that their waters differ in density from the ocean. Thus in the Baltic Sea the waters are so freshened by the contributions of the numerous rivers that they flow out into the North Sea as a surface current, while the heavier ocean water sets in as an undercurrent. The waters of the Red Sea and the Mediterranean, on the other hand, are saltier and denser than the ocean, and as their level is lowered by evaporation a surface current flows in from the ocean, and the heavier waters move out along the bottom.

ORIGIN OF THE OCEANS. The study of the geological history of the oceans is largely speculative. It is apparent, however, that the form of the oceanic basins has undergone changes corresponding to the variations in the continental outlines (see CONTINENT), and it is also probable that the submarine portion of the lithosphere is involved in similar oscillations to those affecting the areas above sea-level. According to Suess, the Atlantic Ocean has resulted from the enlargement northward and southward of the mediterranean sea which during the Cenozoic era extended from Central America to Southeastern Europe. The Pacific Ocean in recent geological times has increased its area by encroachment upon Australia; and the island chains of Polynesia, which are largely of coral formation, may also mark an area of submergence. The Indian Ocean probably occupies a depression in a former land surface (Gondwanaland) that once extended from Central Africa to India.

don, 1873); Thomson and Murray, *Report of the Scientific Results of the Voyage of the Challenger During 1873-76* (ib., 1876-1900); Wild, *Thalassa* (ib., 1877); Sigsbee, *Deep-Sea Sounding and Dredging* (Washington, 1880); Williams, *Geography of the Oceans* (London, 1881); Michelet, *La mer* (7th ed., Paris, 1882); Attlmayr and others, *Handbuch der Ozeanographie und maritimen Meteorologie* (Vienna, 1883); Maury, *The Physical Geography of the Sea, and Its Meteorology* (19th ed., New York, 1883); Simmonds, *Commercial Products of the Sea* (London, 1883); Boguslawski and Krümmel, *Handbuch der Ozeanographie* (Stuttgart, 1884-87); Woodward, "On the Form and Position of the Sea Level," in *United States Geological Survey, Bulletin 48* (Washington, 1888); id., *Allgemeine Meereskunde* (Leipzig, 1893); Daubrée, "Deep-Sea Deposits," in *Smithsonian Institution Report for 1893* (Washington, 1894); Thoulet, *Océanographie* (2d ed., Paris, 1895); Buchan, *Report on Oceanic Circulation* (London, 1895); Wharton, "The Physical Condition of the Ocean," in *Smithsonian Institution Report for 1894* (Washington, 1896); Supan, *Physische Erdkunde* (2d ed., Leipzig, 1896); id., "Die Bodenformen des Weltmeers," in *Petermann's Mitteilungen* (Gotha, 1899); *Oceanic Depths and Serial Temperatures from Indian Marine Survey and British Submarine Telegraph Companies* (London, 1899); Kirchhoff, "The Sea in the Life of Nations," in *Smithsonian Institution Report for 1901* (Washington, 1902); Krümmel, *Der Ocean* (Leipzig, 1902).

OCEAN (in Law). See **HIGH SEAS**.

OCEAN CURRENTS. The consensus of scientific opinion at the present day is to the effect that there are two independent circulations involved in the movement of the waters of the sea, the first, the horizontal, having its source in the energy supplied by the wind; the second, the vertical, sustained by differences of temperature. The phenomena ordinarily described as ocean currents, consisting of the horizontal motion of the layer of water immediately at and near the surface, belong wholly to the former. The vertical circulation applies to the much more comprehensive creeping movement of the warm equatorial waters of the ocean toward the poles, a movement which is confined to the upper strata, and of the cold polar water toward the equator, confined to the depths of the ocean.

SURFACE CURRENTS. As our knowledge of the movement of the surface waters of the ocean has increased, it has become more and more apparent that these so-called currents are very unstable both in velocity and direction. The source—indeed, the only source—from which information concerning them is to be derived is found in the log-books of ships at sea, in which the difference between the observed and the computed position at noon of each day is entered as the current experienced by the ship during the preceding twenty-four hours. Upon assembling a number of such observations, extending over any period of time and covering a limited portion of the surface, a one-degree or five-degree square, for instance, it will be seen that these exhibit the utmost lack of agreement, the only indication of consonance being, indeed, that currents in a certain given direction appear with somewhat great-

er frequency than those in any other. These irregularities stand in close relation to the agency by which the currents themselves are produced, viz. the winds, the movements of the surface water being in response to the impulse communicated to it by the moving air. To explain, however, the fact so frequently noted, that the recorded set of the waters is in direct opposition to that which the prevailing wind would lead us to expect, some little consideration is necessary.

If through any cause a thin layer of liquid is set in motion in its own plane, the layer immediately below it and with which it is in contact does not remain stationary, but likewise receives an impulse. This second layer exercises a like influence over the third, the third over the fourth, and so on, the velocity ultimately attained by each successive layer being proportional to its distance from the bottom layer, which is supposed to be at rest. In the case of sea-water the rapidity with which the surface velocity is propagated downward is exceedingly slight. It has been calculated, for instance, that a period of 239 years would elapse before a layer at a depth of fifty fathoms would attain a velocity equal to half that at the surface, the current at the latter being supposed to flow steadily all the time. In a similar manner, a sub-surface current, once established, exhibits a like reluctance to modify its direction. Immediately at the surface the set of the waters will thus be in close accordance with the direction of the wind; at some little distance below the surface, however, the variations will be by no means so closely followed, owing to the sluggishness with which the impulse is communicated downward; and at a moderate depth it may be assumed that the minor fluctuations are eliminated, and that the mean direction and strength of the current become apparent, being those due to the resultant of the winds.

The system of winds covering each of the great oceans, the North Atlantic, the South Atlantic, the North Pacific, the South Pacific, and the Indian, is practically identical, consisting as it does of a general westward motion of the air on the equatorial side of the tropical belts of high pressure, and of a like easterly motion on the polar side—the former constituting the trade winds, northeast in the Northern Hemisphere, southeast in the Southern; the latter, the prevailing westerly winds of higher latitudes. In each of the oceans there is a general movement of the surface waters in response to these winds; in the tropical latitudes of either hemisphere toward the west—the north equatorial and the south equatorial drift—in extra-tropical latitudes toward the east. The north equatorial and the south equatorial drift carry the waters of the Atlantic toward the shores of America, and the waters of the Pacific toward the shores of Asia and Australia, at a rate varying from 12 to 24 miles per day. The central line of either drift is well defined; along its marginal limits, however, north and south, compensation currents manifest themselves, due to the disturbed equilibrium, which, spreading out at first in sheaf-like form, ultimately reverse their direction and flow to the eastward, those on the equatorial side of the main drifts uniting to form the eastward flowing counter-equatorial current, most apparent during July, August, and September, when it is reinforced by the southwest monsoon winds

of the African and the Central American coasts; those on the polar side becoming merged in the general easterly drift of higher latitudes.

The immense mass of water carried by the equatorial drifts in the great oceans causes an accumulation upon the eastern continental shores and a consequent disturbance of equilibrium, which is in each case partially adjusted by a stream current, or current due to gravity alone, which in every case follows the shore line and is directed away from the equator. In the North Atlantic Ocean this current is known as the Gulf Stream; in the South Atlantic as the Brazilian Current; in the North Pacific as the Kuro Sivo; in the South Pacific as the Australian Current; in the Indian Ocean as the Mozambique Current. These are more constant in direction and force than the ordinary drift currents, but likewise are subject to stoppage or even to reversal. Upon attaining middle latitudes the combined effect of the defective force of the earth's diurnal rotation and of the prevailing westerly winds serves to turn them off shore, and their identity is henceforth lost in the general easterly drift of the temperate zone. The easterly drift of extra-tropical latitudes exhibits none of the persistency of the westerly drift of the tropical, the currents reported being apparently quite as variable as the winds themselves.

In the case of the North Atlantic Ocean, the easterly drift divides to the northwestward of the Azores, one portion carrying to the southward along the Peninsular and African shores, and finally reuniting with the north equatorial current, the whole system forming a vast gentle eddy in close agreement with the prevailing winds; the remaining portion carries eastward and northward toward the shores of Great Britain, Scandinavia, and Iceland. Analogy would suggest a like division in the case of each of the other oceans, with the possible exception of the North Pacific. The information as to these oceans thus far accumulated is, however, not sufficient to establish the hypothesis.

VERTICAL CIRCULATION. The theory of a vertical oceanic circulation rests almost entirely upon the study of the thermal conditions existing in the Atlantic. The main facts in support of the theory may be summarized as follows: (1) The bottom water of every ocean in free communication with the pole has a temperature but little different from that in polar latitudes; (2) this is true even in the equatorial regions, where the entire mass of the ocean, in case an influx of cold water did not exist, would by virtue of the insolation attain in the course of time a temperature not lower than 75° F.; (3) the bottom temperatures in the case of those oceans to which the cold polar water has free access are somewhat lower than the bottom temperatures where this communication is restricted; (4) the thickness of this bottom stratum of cold water (600 fathoms) is too great to admit of the explanation that it is the return flow of the warm water carried poleward by the drift surface currents; (5) there is a continual ascent of glacial water under the line, shown by the moderation of the surface temperatures along the equator, and also by the fact that polar temperatures are here attained at less depth than in somewhat higher latitudes; (6) on the basis of this hypothesis the presence of the cold band along the eastern coast of North America can be explained

as the ascent toward the surface of the polar water, diverted from its original equatorial course by the effect of the earth's rotation, and forced up the Atlantic slope.

See ATLANTIC OCEAN; PACIFIC OCEAN; INDIAN OCEAN; GULF STREAM, etc.

OCEAN GROVE. A summer resort in Monmouth County, N. J., 29 miles (51 by rail) south of New York City; on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, E 3). Situated directly on the Atlantic Ocean, south of Asbury Park, from which it is separated by Wesley Lake, Ocean Grove is on the splendid beach for which watering places of the New Jersey coast are noted. It is characterized, moreover, by rigid moral and religious observances due to its management by a church organization. The town, inclosed mostly by natural boundaries, is controlled by a camp meeting association of the Methodist Episcopal Church, founded in 1869, whose regulations enforce a strict respect for the Sabbath, and prohibit theatrical performances and the sale of intoxicants and tobacco. There are three large public buildings: the Auditorium, post office, and school. In the Auditorium, which seats 10,000 persons, religious meetings are frequently held. The Neptune Township high school was erected at a cost of \$72,000. The water-works and electric light plant are owned and operated by the association. The number of summer visitors is estimated at over 25,000, though the permanent population is only about 2775.

OCEANICA, ô'shê-ân't-kâ, or **OCEANIA**. An ill-defined term used by some geographers to designate all the islands situated in the Pacific Ocean. Others include under that name also the East Indian Archipelago. The best usage seems to confine the name to the small islands lying between Australasia on the west and the American continent on the east. These islands fall ethnologically, and to a certain extent geographically, into three main divisions: Melanesia (q.v.), in the southwest, nearest to the Australian continent; Micronesia (q.v.), in the northwest; and Polynesia (q.v.), the largest in extent, including all the islands east of the former two. Consult: Gill, *The South Pacific and New Guinea Past and Present* (Sydney, 1892); Baessler, *Neue Südsee-Bilder* (Berlin, 1900); Schanz, *Australien und die Südsee an der Jahrhundertwende. Kolonialstudien* (Berlin, 1901).

OCEANIC DEPOSITS. The materials forming the floor of the ocean may be classed as terrigenous deposits, which have been derived from the waste of the adjacent land, and as pelagic or abyssal accumulations, which are found in the open ocean beyond the influence of the land. The terrigenous deposits, comprising gravel, sand, and clay, are limited in their distribution to the continental shores, seldom occurring at a distance of more than 200 miles from the land. **As**

COPYRIGHT, 1908, BY DODD, MEAD & COMPANY.

a rule the coarser materials occur in the shallow marginal waters, while the fine sands and muds are found in the deeper portions, where they have been carried by the drifts and currents. In the free ocean the character of the bottom shows little variation over great areas. When the depth is comparatively slight the deposits consist of the shells of minute organisms that live at or near the surface, of volcanic dust, bones and teeth of fish, and chemical precipitates. The most widespread and characteristic material in the tropical and temperate regions is globigerina ooze, an accumulation of the fossil calcareous casts of foraminifera. In the colder waters, such as those of the South Atlantic and the Southern Ocean, the principal organisms are of siliceous character, and their remains compose the diatom ooze that is so characteristic of those regions. When the floor lies at a depth of 2500 fathoms or more, only the most refractory materials can resist the solvent action of the water, and the deposits take the form of a red or brownish clay composed of the insoluble portions of shells, mixed with meteoric and volcanic dust. These deposits cover great areas in the middle portion of the Atlantic and the northern part of the Pacific Ocean. See OCEAN; DEEP-SEA EXPLORATION; OOZE, etc.

OCEANIC FAUNA. See DEEP-SEA EXPLORATION; OOZE; PELAGIC ANIMALS.

OCEANIDS (Gk. Ὠκεανίδες, *Ōkeanides*). The three thousand daughters of Oceanus and Tethys, nymphs of the sea.

OCEAN LIFE. Ocean life embraces the great company of marine animals, which includes representatives of every phylum. It appears certain that life originated in the ocean (see PROTOZOA), and for a long period at the beginning of the living world remained there exclusively, developing a wide variety and considerable advancement in organization before living beings obtained any foothold on dry land. Great numbers of low forms remain in the oceans (see PELAGIC ANIMALS; OOZE) in substantially the primitive form and condition, owing to the comparative immutability of their environment. Some are very widely distributed, others kept within narrow bounds by inability to dwell except under accustomed conditions of temperature, pressure (according to depth), or within definite food-yielding areas. Great numbers are fixed and stationary in adult life. Hence zones and areas of distribution, both lateral and vertical, exist. (See DISTRIBUTION OF ANIMALS.) That the land was populated primarily from the sea is conceded by all naturalists; it is also true that many creatures once terrestrial have been relegated to a wholly marine existence by force of circumstances acting through long past ages, a conspicuous example of which is the group Cetacea (q.v.). See DEEP-SEA EXPLORATION.

OCEANOGRAPHY (from Ὠκεανός, *Ōkeanos*, ocean + -γραφία, -graphia, description, from γράφειν, *graphein*, to write). The name given to the branch of geography which deals with the phenomena of the collected waters of the earth—the oceans and seas. The name has only recently come into general use, as a result of the great expansion in our knowledge concerning the ocean during the last thirty years. See DEEP-SEA EXPLORATION; OCEAN; GEOGRAPHY.

OCE'ANUS (Lat., from Gk. Ὠκεανός, *Ōkeanos*). In classical mythology, the eldest of the Titans, son of Uranus and Gæa, and father, by his sister Tethys, of the 3000 Oceanids, or ocean nymphs. In Homer Oceanus is the ever-flowing stream which surrounds the circular plain of the earth. From him come all streams and fountains, and even the sea. Hesiod first gives the accepted genealogy. He does not appear in any of the myths as a governing personality like Poseidon, but only as a spectator. In the *Prometheus Bound*, Æschylus introduces him as advising the captive to submit to Zeus. Representations in art are very rare before the Hellenistic period, when he is depicted, like the river gods, as a bearded man, often with horns, and is characterized by the steering oar, or the sea animals surrounding him.

OCELUS LUCA'NUS (Lat., from Gk. Ὀκελλος, *Okellos*). A Lucanian Greek and member of the Pythagorean School; perhaps of the fifth century B.C. Stobæus, i. 13, has preserved a fragment of his work in Dorian dialect; and we hear of various philosophical writings which have now been lost. The extant work *On the Nature of the Universe* (Περὶ τῆς τοῦ Παντός φύσεως) in the Ionic dialect, which bears Ocellus's name, is certainly a work of the later Peripatetic School, and cannot be earlier than the first century B.C.; it may be still later, as it shows remarkable coincidences with the similar work of Nicolaus Damascenus. In four chapters the book handles the themes of the eternity of the cosmos, the distinction between the permanent and the transitory, the divisions of the universe, the heavens, earth, and the human race, the nature of time, etc., all being based on the writings of Aristotle. The work closes with a consideration of the relation of the propagation of humankind to certain cosmic and moral questions. It is best edited in vol. i. of Mullach's *Fragmenta Philosophorum Græcorum* (Paris, 1860); English translation by Thomas Taylor (London, 1831).

OCELOT, ō'sê-lôt (Mexican *ocelote*). A beautiful wild cat (*Felis pardalis*) of tropical America, from Louisiana to Brazil. It inhabits forests, is an agile tree-climber, and preys mainly on birds. It is from two feet six inches to three feet long, exclusive of the tail, which is from 11 to 15 inches, and nearly of uniform thickness. The ears are thin, short, and pointed. The muz-

THE OCELOT.

zle is rather elongated. The colors vary considerably, but the ground tint is rich reddish gray or tawny, blending finely with the dark brown on the margins of the elongated spots, of which there are chains on the sides; the head, neck, and legs being also variously spotted or

barred with dark brown or black. The ocelot is easily tamed, and is very playful, but excessively mischievous and bloodthirsty. This animal is often called a 'panther-cat.'

OCHELHÄUSER, ək'-hoi'zēr, WILHELM VON (1820-1902). A German economist and Shakespearean scholar. He was born at Siegen; was educated for a commercial career, and held several posts in the Imperial Ministry of Commerce. Oechelhäuser was appointed to the colonial council in 1893, and in the same year received an honorary doctor's degree from Erlangen. In the field of economics he wrote: *Die Tarifreform von 1879* (1880); *Die Arbeiterfrage* (1886); and *Soziale Tagesfragen* (1889). He did much to further the study of Shakespeare in Germany as founder and president of the *Shakespearegesellschaft*, as editor of a stage edition of Shakespeare (1878; 14th ed. 1894), and as author of *Einführungen in Shakespeares Bühnendramen* (3d ed. 1895) and *Shakespeareana* (1894).

OCHRE. See OCHRE.

OCHINO, ɔ-kē'nō, BERNARDINO (1487-1566). An Italian preacher and theologian, born at Siena. He entered the Franciscan Order, and then the still more ascetic Order of the Capuchins, of which he was made general in 1538 and reflected in 1541. Remarkable for his preaching by Charles V., he rose to be confessor to Pope Paul III. The Reformation had begun to make converts in Italy, and Ochino's friends, among whom were Juan de Valdés and Vittoria Colonna, were suspected of leanings toward heresy. His sermons delivered at Venice (1539) showed the influence of the Reformation, but no active step was taken until 1542, when he was commanded to appear before the Inquisition in Rome and answer certain charges. Fearing the consequences, Ochino made his way to Geneva. Here he published some more sermons of a Calvinistic nature, under the title *Prediche* (1542-44), translated into German (1545), French (1546 and 1561), and English (1548). But with Calvin himself he could not agree. He left Geneva and wandered into Germany, spending some time at Augsburg (1545-47) as pastor of the Italian Protestant church there. He then went to London (1547-53), where he became a prebendary of Canterbury, and was pensioned by Edward VI. His *Tragedy*, written in London, is supposed to have influenced Milton's *Paradise Lost*. In 1555 he went to Zurich, but his congregation was scandalized by his doctrines concerning polygamy and the Trinity, and he moved on to Cracow. Here, again, his sermons were criticised, and he died not long afterwards at Schladau in Moravia. Consult Benrath, *B. Ochino von Siena* (Leipzig, 1875, and Brunswick, 1892; English translation, New York, 1877).

OCHOA, ɔ-chō'ā, EUGENIO DE (1815-72). A Spanish poet, critic, and scholar, born at Lezo, in the Province of Guipúzcoa. He studied in Madrid and then went to Paris (1829), where he worked at the Ecole des Arts et Métiers. On his return to Madrid he contributed to the *Gaceta de Madrid*, directed by Alberto Lista. After the defeat of his political friends, he went back to Paris, and, with Baudry, edited the *Colección de los mejores autores españoles*, and prepared some new editions of Spanish classics. His volume of poems, *Ecos del alma*, appeared in 1841, and in 1844 he made a *Catálogo razonado* of all Spanish

manuscripts in the Paris libraries. In the same year he returned to Madrid, and was appointed under-librarian of the National Library, and a member of the Spanish Academy and of the Academy of History. His works include: *Incertidumbre y amor* (1836); *Paris, Londres y Madrid* (1861); and *Miscelánea de literatura, viajes y novelas* (1867).

OCHRE, ɔ'kēr (Fr. *ocre*, from Lat. *ocra*, from Gk. *ὄκρα*, yellow ochre, from *ὤχρος*, *ōchros*, pale). A mineral paint consisting of clay colored with some oxide of iron, rarely of manganese, in various proportions, giving to the clay a lighter or deeper color. Ochres are common in many geological formations, more especially the younger ones, in which the materials are consolidated. For use the material is dried, ground, and mixed with oil. The commercial value of the material depends on its shade of color, the regularity of distribution of the iron coloration, and the quantity of oil which is required to mix it up. Calcination is sometimes resorted to in order to produce the desired tint; the operation adds much to the depth of color, by increasing the degree of oxidation of the contained iron. The common color of ochre is yellow. Umber and sienna differ from ochre in containing manganese in addition to the iron. Raw umber has a brown color, while burnt umber is of a red tinge. Raw sienna is brownish yellow, but when burned it yields a rich russet brown pigment. The finer grades of ochres are used by painters, the coarser by carpenters for marking out their work, etc. Common ochre is found in many parts of the United States. The most important States producing it are Alabama, Arkansas, California, Georgia, Iowa, Maryland, Massachusetts, Missouri, New York, Pennsylvania, Texas, Vermont, and Virginia. Umber and sienna are produced by New York, Pennsylvania, and Missouri, but much is also imported. France leads the world in the production of ochre, with Germany second, and the United States third. Consult: Volumes of *Mineral Resources*, issued by United States Geological Survey (Washington, annually); Hill, "Report on Metallic Paint Ores Along the Lehigh River," *Annual Report of the Pennsylvania Geological Survey* (Harrisburg, 1886).

OCHRO. A vegetable. See HIBISCUS.

OCHTERLONY, ɔk-tēr-lō'nf, Sir DAVID (1758-1825). A British general in India. He was born in Boston, Mass., of Scotch ancestry, and in 1777 went to India as cadet. In 1814, after the rising of the Nepalese, Ochterlony was put in command of the forces west of the Gurkha frontier, and was successful in storming the forts in the hills, when the three other divisions were defeated or inactive. He closed the campaign at Malaun, where he received the surrender of Amar Singh. Again, in the following year, when the Gurkha Government failed to ratify the peace, Ochterlony with great energy and brilliancy reduced all opposition.

OCHTMAN, ɔk'man, LEONARD (1854-). An American landscape painter, born at Zonne-maire, Zeeland, Holland. His family removed to America in 1866 and settled at Albany, N. Y. For a time he worked at engraving, but afterwards studied painting at the Art Students' League in New York City. His subjects are usually country scenes on or about the Mianus

River. He chose tranquil, quiet stretches of water, shaded by trees, and bathed in moonlight, as in his "Night on the Mianus River," which won a medal at the World's Fair in 1893; "Autumn Moonlight;" "Moonlight Night in Spring;" His "Winter Morning," "The Enchanted Vale," "Among the Hills," "View from the Great Hill," "Early Morning," and "A Morning Symphony" are day scenes of equal charm and truth. His work is all distinguished by broad painting, simplicity of expression, serenity of effect, and a certain largeness of treatment that is very characteristic.

OCK'EL, EDUARD (1834—). A German landscape and animal painter, born at Schwante, Brandenburg. As a pupil of Steffek in Berlin, he painted portraits and animals, then studied under Couture in Paris (1858), and from nature in Normandy and in the forest of Fontainebleau, adopting the realistic conception and poetic color treatment of the school of Barbizon, where he lived for several years. The National Gallery in Berlin contains "Cows at the Fairy Pond, Fontainebleau," "Autumn Evening in the Mark," and two others. His other principal works include: "Ploughing Oxen" (1866); "Stags Before the Fight" (1876); "Steinitz Lake in Autumn" (1884); and "The Four Seasons" (1892).

OCKLEY, 8k'li, SIMON (1678-1720). An English Orientalist. He was born at Exeter, entered Queen's College, Cambridge, in 1693, and in 1705 became vicar of Swavesey. He devoted himself with great assiduity to the study of the Oriental languages. From Arabic manuscripts in the Bodleian Library, Oxford, he prepared *The History of the Saracens* (1708-18), a work containing much serviceable information. In 1711 he was made professor of Arabic in the University of Cambridge. His further works, all noted for their accuracy and erudition, include: *Introductio ad Linguas Orientales* (1706); a translation of Leon Modena's Italian *History of the Present Jews Throughout the World* (1707); and *The Improvement of Human Reason, Exhibited in the Life of Hai ben Yokdhan* (1708).

OCMUL'GEE. A river of Georgia, formed by several headstreams, near Atlanta, in the northern part of the State (Map: Georgia, D 4). It flows south-southwest, finally turning eastward, and joins the Oconee in Montgomery County to form the Altamaha. It is about 275 miles long, and navigable for small steamers to Macon about half way to its source. Its upper course is broken by many rapids, and furnishes water power, while its lower course is through pine barrens.

O'CONNELL, DANIEL (1775-1847). An Irish politician. He was the eldest son of an ancient but unimportant family of County Kerry, Ireland, and was born on August 6, 1775. O'Connell received his first education from a hedge schoolmaster, but afterwards, under the patronage of his uncle, Maurice O'Connell, attended Father Herrington's school at Cove, and the Catholic colleges of Saint-Omer and Douai, France. His scholarship had just begun to win for him promises of a brilliant future when he was driven home prematurely by the outbreak of the French Revolution, and in 1794 he entered as a law-student at Lincoln's Inn. In 1798 he was called to the Irish bar. By degrees, the Roman Catholic party having begun to rally

from the prostration into which it had been thrown by the rebellion of 1798, O'Connell was drawn into public life, and his unquestioned ability soon made him a leader. He was an active member of all the successive associations which, under the various names of 'Catholic Board,' 'Catholic Committee,' 'Catholic Association,' etc., were organized for the purpose of procuring the repeal of the civil disabilities of the Catholic body. Of the Catholic Association he was himself the originator; and by means of this association he created so formidable an agitation throughout Ireland that it gradually became apparent that the desired measures of relief could no longer be safely withheld. The crisis was precipitated by the bold expedient adopted by O'Connell, of causing himself to be elected member of Parliament for Clare in 1828, notwithstanding his incapacity to serve in Parliament, in consequence of his being obliged to refuse the prescribed oaths of abjuration and supremacy, which then formed the ground of the exclusion of Roman Catholics from the Legislature. This step, although it failed to procure for O'Connell admission to Parliament at the time, led to discussions within the House, and to agitations outside so formidable that in the beginning of the year 1829 the Duke of Wellington and Sir Robert Peel found it expedient to give way; and deserting their party in the face of strenuous Tory and Royal resistance, they introduced and carried through, in the spring of that year, the well-known measure of Catholic emancipation. O'Connell was at once reelected and took his seat for Clare, and from that date until his death continued to sit in Parliament. During all these years he received, by means of an organized annual subsidy, a large yearly income from the voluntary contributions of the people, by whom he was idolized as their 'liberator,' and who joined with him in all the successive agitations against the Act of Union, against the Protestant Church establishment, and in favor of reform, in which he engaged. In the progress of more than one of these political agitations his associations were opposed by the Government. The agitation for the repeal of the Union, begun in 1841, was carried on by 'monster meetings' throughout Ireland, at which O'Connell himself was the chief speaker. This agitation assumed proportions so formidable that O'Connell, in common with several others, was indicted for a seditious conspiracy in 1843, and was convicted and sentenced to a year's imprisonment, with a fine of £2000. This judgment was reversed by the House of Lords; and O'Connell, on his discharge, resumed his career. But his health had suffered from confinement, and still more from dissensions and opposition in the councils of his party; and since, on the return of the Whigs to power in 1846, he consented to support their Government, the malcontents of the repeal association openly separated from him, and a bitter feud between 'young' and 'old' Ireland ensued. In this quarrel O'Connell steadfastly maintained his favorite precept of 'moral force,' and was supported by the great body of the Catholic bishops and clergy; but his health gave way in the struggle. He was ordered to try a milder climate, and on his journey to Rome in the spring of 1847 he was suddenly seized with paralysis, and died at Genoa on May 15th of that year. As a public speaker, and especially as a master of popular eloquence, he

was almost unsurpassed in his day. His ability as a lawyer was of a high order. He published a single volume, *A Memoir of Ireland, Native and Saxon*, and a few pamphlets, the most important of which, as illustrating his personal history and character, is *A Letter to the Earl of Shrewsbury*. Consult: O'Connell (son), *Life and Times of Daniel O'Connell* (Dublin, 1846); id., *Recollections and Experiences During a Parliamentary Career from 1833 to 1848* (London, 1849); Fitzpatrick, *Correspondence of Daniel O'Connell* (ib. 1888); Daunt, *Recollections of Daniel O'Connell* (ib. 1848); Fagan, *Life of Daniel O'Connell* (Cork, 1847).

O'CON'NOE, ARTHUR (1763-1852). An Irish revolutionist, born at Mitchelstown, County Cork. He graduated at Trinity College, Dublin, in 1782, and in 1788 was called to the bar. In 1796 he joined the 'United Irishmen,' and was arrested and imprisoned for six months. On regaining his liberty he became editor of the *Press*, the organ of his society. During a visit to England he was arrested and tried for high treason, and though acquitted was kept in prison on other charges until June, 1803. He then went to France, where he entered the military service under Napoleon. He published *A Speech on the Catholic Question* (1795); *State of Ireland* (1798); *Actual State of Great Britain* (1804); and *Monopoly, the Cause of All Evil* (1848).

O'CONNOR, FEARGUS EDWARD (1794-1855). An Irish politician and Chartist leader, born in County Meath. In 1832 he sat in Parliament for Cork, and when reelected in 1835 was unseated through the lack of property qualifications. He thereupon engaged in the Radical agitation in England, spoke frequently, and founded at Leeds a weekly organ, the *Northern Star*. In 1838 he was foremost in the consolidation of the Chartists, and to that party his somewhat incoherent eloquence lent valuable support. In 1846 he organized the National Land Company, for the purpose of buying up agricultural estates and dividing them into small holdings. Several estates were bought, but the scheme came to nothing. The next year he reentered Parliament for Nottingham, and in 1848 presented to the Lower House his monster petition containing nearly two million names. The movement disappeared soon afterwards and O'Connor became insane in 1852.

O'CONNOR, RODERIC (1116-98). King of Ireland. He was the son of Turlough O'Connor, King of Connaught, whom he succeeded in 1156. After a protracted contest with the O'Briens and others, he took the title of King of Ireland in 1166, though he had no hereditary claim. He drove Dermot, King of Leinster, out of his kingdom, but afterwards reseated him on the throne. He worsted Strongbow and the English in a number of battles, but in 1175 entered into a convention with them, by which Henry II. was recognized as overlord, while O'Connor was to retain the crown of Connaught, and continue to be the head of the Irish chiefs. Roderic kept the crown till 1186, when he was deposed by a revolt of one of his sons. In 1189 he was again King for a short time, after which he entered a monastery, where he passed the rest of his life.

O'CONNOR, THOMAS POWER (1848-). An Irish journalist and politician. He was born at Athlone, in the County of Roscommon, Ireland,

and was educated at the College of the Immaculate Conception, Athlone, and at Queen's College, Galway. He commenced life as a journalist, and after being connected for three years with the Dublin press, was employed on several London journals. In 1880 he was elected member of Parliament for Galway, and soon became one of the most active and prominent members of the party led by Parnell. In 1881 he made a tour through the United States, attended the Irish-American convention and lectured on the Irish cause to large gatherings in nearly all the important cities, raising large sums of money. In 1883 he was elected president of the Irish National League of Great Britain. Since 1885 he has been four times elected member of Parliament for a division of Liverpool. From 1888 to 1890 he edited the *Star*, of which he was the founder. He also founded and edited the *Sunday Sun*, the *Sun*, and *M. A. P.*, a society journal. Besides numerous tales, essays, and magazine articles his published works include: *Lord Beaconsfield: A Biography* (6th ed. 1887); *The Parnell Movement* (1887); *Gladstone's House of Commons* (1885); and *Napoleon* (1896).

OCON'OMOWOC. A city in Waukesha County, Wis., 31 miles west by north of Milwaukee; on the Chicago, Milwaukee and Saint Paul Railroad (Map: Wisconsin, E.5). It is a noted summer resort, picturesquely situated on lakes La Belle and Fowler, and in the heart of a beautiful lake region, popular for its fishing. It has a sanatorium and a public library. Farming, dairying, and stock-raising are the leading industries of the vicinity. The water-works and electric light plant are owned and operated by the municipality. Population, in 1890, 2729; in 1900, 2880.

O'CON'OR, CHARLES (1804-84). An eminent American lawyer. He was born in New York City, and was admitted to the bar in 1824. He devoted himself with great energy and enthusiasm to his profession, and in a very few years was recognized as one of the ablest and most brilliant members of the New York bar. He was an active supporter of the Irish nationalist movement, and for many years after 1848 was a member of the directory of the Friends of Ireland. He was a strong believer in the doctrine of States' rights, and throughout the Civil War was warmly in sympathy with the South. After the close of the war he voluntarily offered his services as counsel for Jefferson Davis when indicted for treason, and afterwards with Horace Greeley went on his bail bond. He was associated with William M. Evarts and Wheeler H. Peckham in the prosecution of the 'Tweed Ring' conspirators, and the organization of the suits against them was largely his work. In 1872 he was nominated, in the face of his absolute refusal, for President of the United States, by a convention held at Louisville, Ky., composed of that portion of the Democratic Party which declined to indorse the Liberal Republican nomination of Horace Greeley. John Quincy Adams, the nominee for Vice-President, also declined, but the ticket remained in the field and 29,489 votes were cast for it.

OCON'OSTOTA (properly, *Agana-stata*, Ground-hog sausage). A Cherokee chief and leader of his tribe in their war with the English (1759-61). Before the actual outbreak of hos-

ilities a delegation of 32 chiefs, headed by Oconostota, had come down from the mountains to arrange a peaceable settlement of the questions at issue, but by order of Governor Lytleton of South Carolina the whole party was seized and thrown into prison at Fort Prince George, where they were kept under close confinement until it was thought that the Indians had been terrorized into submission, when Oconostota and two others were set at liberty, the rest being still held as hostages. Oconostota collected his warriors and besieged the post, completely cutting off communication for about two months. In February, 1760, on pretense of a desire for a conference, he decoyed the commander outside the stockade, where, upon a concerted signal, the officer was shot down from ambush. All the hostages in the fort were immediately massacred by the garrison in retaliation. War now broke out along the whole Carolina border, Oconostota being the leading spirit among the Cherokee. In June, 1760, a force of over 1600 troops under Colonel Montgomery invaded the Cherokee country and destroyed one town after another almost without resistance until Nikwasi was reached, near the present Franklin, N. C., where Montgomery was defeated and forced to retire upon Fort Prince George with heavy loss. Six weeks later the garrison of Fort Loudon, near the present Loudon, Tenn., was compelled to surrender to Oconostota in person, on promise of permission to withdraw in safety on surrender of their war stores. Finding, however, that the compact had been broken by the concealment of a large quantity of arms and ammunition, the Indians attacked the departing troops and killed 30, including the officer in charge, holding the rest as prisoners until ransomed later. In June, 1761, Colonel Grant with 2600 men again invaded the Cherokee country, and by the destruction of their fields and settlements so nearly reduced the Indians to starvation that they were finally compelled to sue for peace. Oconostota retained his authority in his nation and in 1768 headed a delegation which, at Johnson Hall in New York, concluded a lasting peace with their old-time enemies, the Iroquois. He took no active part in the Revolutionary struggle, being already worn out by infirmities, and in 1782 formally resigned his chieftainship in favor of his son. He was still living in 1809.

OCONTO. A city and the county-seat of Oconto County, Wis., 157 miles north of Milwaukee; at the mouth of the Oconto River on Green Bay, and on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads (Map: Wisconsin, F 4). It has large lumber interests and an extensive trade in fish; the industrial establishments, besides the lumber manufactories, include flouring mills, a brewery, canning factories, etc. A productive farming, stock-raising, and dairying region is adjacent to the city. There are fine court-house and high-school buildings and a public library (\$15,000). Settled in 1850, Oconto was first incorporated in 1882. It is governed, under a revised charter of 1891, by a mayor, elected every two years, and a council. Population, in 1890, 5219; in 1900, 5646.

OCTAGON (Gk. *ὀκτάγωνος*, *oktagónos*, eight-cornered, from *ὀκτώ*, *oktō*, eight + *γωνία*, *gónia*, angle). A polygon (q.v.) of eight sides. If the

sides and angles are respectively equal, the figure is called a *regular octagon*. In this case each interior angle is 135° and each exterior angle is 45° . If the alternate vertices of a regular octagon be joined, a square is formed; and since the angle between a side of the octagon and a side of the square is one-fourth of a right angle, the regular octagon may easily be constructed from a square as a basis.

OCTAHEDRITE, or ANATASE. A mineral composed of titanium oxide, identical in composition with rutile and brookite, but differing in crystal habit. It crystallizes in the tetragonal system, usually in pyramidal form, has a metallic adamantine lustre, brown or black color, and a hardness of 5.5 on the mineral scale. It is found at Smithfield, R. I., in Burke County, N. C., and at various localities in Europe.

OCTAHEDRON (Gk. *ὀκταέδρον*, *oktaedron*, neu. sg. of *ὀκτάεδρος*, *oktaedros*, having eight bases, from *ὀκτώ*, *oktō*, eight + *ἑδρα*, *hedra*, base). A solid bounded by eight faces. If the faces are equilateral triangles, four meeting at each vertex, the figure is called a *regular octahedron*. (See POLYHEDRON.) This solid has four axes of symmetry, passing through opposite vertices, and is one of the five Platonic bodies, or regular polyhedra. The octahedron is a common form in crystallography, appearing as regular, square, and rhombic. Native sulphur is an example of the rhombic system.

OCTAVE (Fr. *octave*, from ML. *octava*, octave, from Lat. *octavus*, eighth, from *octo*, Gk. *ὀκτώ*, *oktō*, Skt. *aṣṭan*, Lith. *aštuoni*, OIr. *ocht*, Goth. *ahtáu*, AS. *eachta*, OHG. *ahto*, Ger. *acht*, Eng. *eight*). The interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval. There is between a note and its octave a far closer relation than between any other two notes; they go together almost as one musical sound. In combination, they are hardly distinguishable from one another, and their harmonics agree invariably, a coincidence which occurs in the case of no other interval. For the purpose of absolute pitch every tone is regarded as belonging to a particular series of octaves. The octave from middle C (q.v.) to the C below is called the *small octave*, the next lower the *great octave*, because in numerical notation (q.v.) these tones are indicated respectively by the small and capital letters of the alphabet. The octave C-C is called the *contra octave*. The octave from middle C upward is the *one-lined octave*, the next the *two-lined octave*, etc.

OCTAVIA. The sister of the Roman Emperor Augustus, and wife of Marcus Antonius. She was distinguished for her beauty, her noble disposition, and her womanly virtues. Her first husband was C. Marcellus, to whom she was married in B.C. 50. He died in B.C. 41, shortly after which she consented to marry Antonius, to make secure the reconciliation between him and her brother. The event was hailed with joy by all classes. In a few years Antonius forsook her for Cleopatra. When the Parthian War broke out, Octavia wished to accompany her husband, and actually went as far as Corcyra, whence Antonius sent her home, that she might not interrupt his

guilty intercourse with the Egyptian Queen. In B.C. 35 Octavia made an effort to rescue him from a degradation that left him indifferent even to the honor of the Roman arms, and sailed from Italy with reinforcements; but a message reached her at Athens ordering her to return home. She proudly obeyed, but, with a magnanimity that reminds us of the Roman character in earlier and better days, she forwarded the supports to her husband. Her brother was indignant at the treatment she had received, and would have had her leave her husband's house, and come and live with him; but she refused. When, in B.C. 31, war, long inevitable, broke out between her brother and Antonius, the latter crowned his insults by sending Octavia a notice of divorce. After her husband's death, she brought up with maternal care not only her own children, but also those of Cleopatra. Her death took place in B.C. 11. Her son Marcellus (q.v.) was adopted by Augustus as his successor, but died in B.C. 23.

OCTAVIA (c.42-62). A Roman empress, wife of Nero. She was the daughter of Claudius and Messalina and married Nero when he was sixteen and she eleven. He deserted her for Acte, and then for Poppæa, at whose request she was divorced and sent to Campania. She was soon recalled because of the outburst of anger on the part of the Roman populace; but, through Poppæa's jealousy, a charge of adultery was brought against her and she was sent to the island of Pandataria and there killed when she was only twenty. The tragedy *Octavia*, of which she is the heroine, usually attributed to Seneca, is probably by some other author, perhaps Curatius Maternus.

OCTAVIAN. See **AUGUSTUS**.

OCTO-BASS. A double bass invented by Vuillaume in 1851. It is of enormous dimensions, four meters high, and has three strings (C, G, C), which are stopped by mechanism. The tone is powerful and mellow, but, owing to its enormous size, it is not used in orchestras.

OCTOBER. See **MONTH**.

OCTOCORAL/LA (Neo-Lat., from Lat. *octo*, eight + *corallum*, coral). A subclass of ctenophores. The families Alcyonidae, Pennatulidae, and Gorgonidae are represented by scattered fossil remains throughout the Mesozoic and Cenozoic formations. Another family, the Helioporidae, appears in the Tertiary and Mesozoic, and seems to be represented in the Paleozoic by the Heliolitidae, an important group of reef-building corals of somewhat uncertain affinity that exhibits analogies to the Favositidae and Chætetidae. See **CORAL**; and **HELIOLITES**.

OCTOP'ODA (Neo-Lat. nom. pl., from Gk. *ὀκτώπους*, *oktōpous*, having eight feet, from *ὀκτώ*, *oktō*, eight + *πούς*, *pous*, foot). An order of dibranchiate cephalopods having eight arms, the suckers on which are sessile and devoid of horny rims. It includes the argonaut and the various species of *Octopus* (q.v.).

OCTOPUS (Neo-Lat., from Gk. *ὀκτώπους*, *oktōpous*, having eight feet). The type genus of the Octopoda (q.v.), differing from the squid and cuttlefish in having eight instead of ten arms, all of the same size, and a pear-shaped or sack-like body. The arms are connected at the base by a web. Two cartilaginous stylets imbedded in

the dorsal mantle are said by Owen to represent the shell. The body of the 'poulpe,' 'devilfish,' or octopus, is baggy, short, soft, with no fins. It lives in interstices of coral reefs, among rocks, and the like. The right arm of the third pair is hectocotylized in the male, i.e. the arm is modified in various ways, but is never detached and

A HECTOCOTYLIZED ARM.

left within the female, as in the argonauts. The best known species is *Octopus vulgaris*, of the Mediterranean and West Indies, which may reach a length of nine feet and weigh upward of 60 pounds. A tropical species (*Octopus granulatus*) is shown on the Colored Plate of **OCTOPODS** AND **DECAPODS**, under **DECAPODA**.

Octopus Bairdii inhabits the Gulf of Maine at a depth of from 50 to 100 fathoms. On the

OCTOPUS BAIRDII.

1. Attitude in swimming (toward the left). 2. Attitude when at rest.

southern coast of the Eastern United States from Cape Hatteras down is an octopus whose arms expand nearly four feet. The Pacific coast species is *Octopus punctatus*, which is known to expand 14 feet from tip to tip of the outstretched arms. It lives just below low-water mark and is caught and impaled by means of a pointed stick by Chinese and Italians, who use it as an article of food. At times pearl-divers and shell-collectors on the coral reefs may be attacked and hurt by octopods, as they are armed with formidable teeth; the difficulty of tearing away their arms and the fright caused by their hideous appearance are said to have resulted in death. The ordinary food of this animal is shellfish and other invertebrates. Consult: *The Standard Natural History* (Boston, 1885); Packard, *Zoology* (New York, 1897); Cooke, *Cambridge Natural History*, vol. iii. (London, 1899).

OCTOSTYLE (Lat. *octastylus*, from Gk. *ὀκτά-στυλος*, *oktastylos*, having eight columns, from *ὀκτώ*, *oktō*, eight + *στυλος*, *stylos*, column). The name given in classic architecture to a temple or other building with eight columns across the front.

OCTROI, *ok'trwä'* (Fr., grant). The term applied to the toll or tax in kind levied from a very early period in France, and other countries.

of Europe, on articles of food which were brought past the barrier or entrance of a city or town. The octroi came eventually to be levied in money, and was abolished in France at the Revolution. In 1799, however, it was reestablished, under the pretext that it was required for purposes of charity, and since then it has been successively changed and modified. The proceeds of the octroi duty which is at present levied at the gates of the French towns are divided so that one-tenth goes to the national treasury, and the rest to local expenses. These duties are allowed on drinks, eatables, fuel, fodder, and building materials. A new octroi must be established by statute, and every increase in the rates requires the approval of the higher authorities. The octroi duties are not popular, since they increase considerably the cost of living in towns and cities; but it would be difficult to abolish them, since the towns depend upon them very largely for revenue. Outside of France they are found also in Italy, and in a few towns of Bavaria and Austria.

O'CURRY, EUGENE (1796-1862). One of the most distinguished of Gaelic scholars. He was born at Dunaha, County Clare, Ireland, in 1796, and worked as a boy on his father's farm. From 1834 to 1837 he was employed in the topographical and historical section of the Ordnance Survey. Then for many years he was chiefly occupied in copying important Irish manuscripts for the Royal Irish Academy, Trinity College (Dublin), the British Museum, and other institutions. In this way O'Curry acquired a knowledge of the contents of Irish manuscripts that has been seldom equaled. He published nothing, however, till he was well past middle life. In 1851 he contributed to a work by Dr. Reeves, a translation of some Irish poems in the *Codex Maelbrihte*. In 1853 he became a member of the council of the newly organized Celtic Society, which two years later published an edition by him of the *Battle of Magh Leana and Tochmare Momera*. In 1855-56 he gave his first course of lectures as professor of Irish history and archaeology in the Catholic University at Dublin. The lectures were published in 1860 under the title, *The Manuscript Materials of Irish History*. From 1857 till 1862, the year of his death, he continued to lecture at the university, and the material of his courses was afterwards gathered together in two volumes, *On the Manners and Customs of the Ancient Irish People*, edited by W. K. Sullivan and published in 1873.

O'CYDRONE. A form of rail. See **WEKA**.

ODAL, or **UDAL** (from Icel. *odal*, AS. *spel*, OHG. *uodil*, hereditary possession; connected with Icel. *adal*, OHG. *adal*, Ger. *Adel*, race, nobility). The name of an ancient system of land tenure in northern Europe, in which the land was held absolutely, and not from a superior, as was the case where feudalism prevailed. The odal tenure prevails to this day to a large extent in the Orkney and Shetland islands, the right to land being complete, without writing, by undisturbed possession proved by witnesses before an inquest. Consult Stubbs, *Constitutional History of England*, vol. i. (6th ed., Oxford, 1897).

ODD FELLOWS, INDEPENDENT ORDER OF. A fraternal benevolent order, probably founded in England early in the eighteenth century, but in what precise year the records do not show.

The ancient guilds had degenerated into social and convivial clubs, and were replaced by workmen's beneficial societies, out of which were later evolved the Odd Fellows, or Friendly Societies. The earliest record of any of these societies available is that of Aristarchus Lodge No. 9 of the Order of Odd Fellows, which met in 1748 at the Globe Tavern, London. There were many orders of Odd Fellows in England at the beginning of the nineteenth century, of which the Imperial Odd Fellows of Nottingham; the Ancient Noble Odd Fellows, Bolton; the Grand United Odd Fellows, Sheffield; Economical Odd Fellows, Leeds; National Odd Fellows, Salford; and the London United Odd Fellows were the principal ones. Between these there were no official or friendly relations existing. The enactment of severe laws by the English Parliament against secret associations in the last years of the eighteenth century tended to retard the progress of friendly societies, and the Odd Fellows accordingly suspended public operations.

In 1803 the London Union Odd Fellows Society was organized by some of the city lodges under the title of the Grand Lodge of England, and it succeeded in establishing its authority over the greater part of the Odd Fellow societies in the United Kingdom. A member of one of the city lodges had meantime, in 1809, removed to Manchester, and, having received a dispensation to form a lodge in the latter city, the first Victory Lodge was created, and it immediately declared its independence of the Grand Lodge of England. This was the beginning of the movement for independence. In 1810 a union was effected at Salford between a social club and the Prince Regent Lodge of Odd Fellows, and out of it arose the Lord Abercrombie Lodge, based on the principles of mutual relief to the members, an improved financial system, and other new features. Several of the existing lodges, including Victory Lodge of Manchester, gave in their adherence to the new movement, and in 1811 the Lord Abercrombie Lodge assumed supremacy over the lodges working on the new system, proclaiming itself as the 'Lord Abercrombie Grand Lodge of Independent Odd Fellows,' a step which led to considerable opposition among the older lodges of the order. In 1813 a convention was called of the lodges in and around Manchester in sympathy with the new movement. An organization of the lodges was effected, and the title 'The Manchester Unity of the Independent Order of Odd Fellows' adopted. In 1814 a formal organization was effected, a grand committee or district grand lodge was provided, a form of government adopted, and a grand master and a deputy grand master appointed. The formation of provincial districts with a provincial district grand master for each was the most important act of the session of the grand convention of 1815. The adoption of a funeral fund system was part of the work of the annual session of 1816. The question of adopting degrees into the order was also discussed, the degrees of White, Royal Blue, and Scarlet being established. The Patriarchal, the Covenant, and Remembrance degrees were added later. In 1819 the question of a site for the central government of the order was settled by the establishment of a movable committee to hold annual sessions at points agreed upon at a preceding session. In 1822 the first grand movable committee con-

vened; it was composed of past and present officers of districts and lodges, and had the power to adopt or reject laws proposed by districts. In the same year the Loyal Saint Olive's Lodge, in affiliation with the Manchester Unity, was opened in London. In Liverpool considerable discord marked the early operations of the various Odd Fellow lodges until about 1820, when they came under the authority of the Manchester Unity. The order was introduced into Wales in 1820, and into Scotland in 1838. The formation of lodges in Ireland, Germany, and Australia was effected in 1840, and the following year in the Isle of Man.

The first lodge of the Independent Order of Odd Fellows in the United States was formed in 1819. Thomas Wildey and another, both English Odd Fellows, arrived in Baltimore in 1818, and in the spring of the following year associated with three others to form Washington Lodge No. 1 in Baltimore. Wildey was elected Noble Grand. Franklin Lodge No. 2 was created in the same year, also in Baltimore. On February 1, 1820, Wildey and his companions received a charter from one of the English lodges, the Duke of Preston Lodge, constituting it the 'Washington Lodge, the Grand Lodge of Maryland and of the United States of America of the Independent Order of Odd Fellowship.' It thus bore the character of both a subordinate and a grand lodge. The dual character of this charter did not commend itself to the order, and in 1821 it was surrendered, and Washington Lodge became merely a local lodge. Steps were taken to model the government of the order in America after the political system of the United States. The management was to be vested in the representatives of each State Grand Lodge, who together with the past grand masters of the Maryland Grand Lodge were to constitute the governing body of the order. Five of these latter were authorized by charter, dated February 22, 1825, to form a grand lodge for Maryland to take the place vacated by Washington Lodge in 1821. The titles of the chief officers were changed from grand master and deputy grand master to grand sire and deputy grand sire in 1829. A German lodge, William Tell Lodge, chartered in 1827, was the first lodge formed for work in the German language, and became the mother German lodge. The order was incorporated by the Maryland Legislature in 1833. In 1843 all connections with the Manchester Unity were severed, and it was resolved "that to the Grand Lodge of the United States belonged the exclusive authority to erect lodges and encampments of Odd Fellows upon any part or section of the globe."

Meanwhile Odd Fellowship was being established in New York without any knowledge of the previous establishment of the order in America. Solomon Chambers and his two sons, members of the Loyal Westminster Independent Lodge of Odd Fellows, England, came to New York in 1806, and, meeting two other Odd Fellows, organized Shakespeare Lodge of Odd Fellows in New York. This lodge lasted only about four years, when it dissolved. Several other self-instituted lodges sprang into existence during the next ten or twelve years, when Shakespeare Lodge was revived. A lodge was established in Brooklyn—Columbia Lodge—which held a dis-

pensation from an English lodge, the Duke of Sussex, and for some years there was a struggle for the mastery between the New York and Brooklyn lodges, which were in affiliation with the Manchester Unity. The contending lodges were finally brought to acknowledge the authority of the Grand Lodge of the United States, from which a charter for a New York Grand Lodge was subsequently obtained. Dissension and division, however, did not cease until 1866.

There is no record of Odd Fellowship in Canada before 1815, although it is stated that what are known as 'Prehistoric' lodges were to be found at various points. In September, 1843, Prince of Wales Lodge No. 1 of British North America was instituted at Montreal under a charter issued by the Grand Lodge of the United States. The following year a Canadian Grand Lodge was created, and in September, 1846, the Canadian branch of the order was declared free and independent by the Grand Lodge of the United States, which issued to the Canadian lodges a charter under the title of the Grand Lodges of British North America. By 1852, however, this Grand Lodge had practically died of inanition, and in 1853, the Montreal lodges having formally disbanded, the Grand Lodge of the United States recalled the Canadian charter and resumed jurisdiction over the order in Montreal.

In 1868 Australia was added to the domain of the Grand Lodge of the United States, and from time to time other countries have been entered with more or less success. Mexico, the West Indies, Chile, Cuba, Peru, Japan, Denmark, Germany, England, France, Italy, Holland, etc., have been admitted, but the continent of North America has proved the best field for cultivation. In 1879 the Grand Lodge of the United States, recognizing its undisputed sway in the world of Odd Fellowship, changed its title, and is now known as the Sovereign Grand Lodge of the Independent Order of Odd Fellows.

Three degrees are conferred in the subordinate lodge, and any Odd Fellow who has attained the third degree is eligible for membership in an encampment, a branch or department chartered within the order by the Grand Lodge of Maryland in 1827. The encampment confers three degrees, the Patriarchal, the Golden Rule, and the Royal Purple. The Patriarchal is an English degree, and the others are American. The first Right Worthy Grand Encampment was created and officers installed in Baltimore in 1831. Membership in an encampment is dependent on good standing in a lodge, but otherwise the two are independent.

The Patriarchs Militant, a uniformed degree of the order, came into existence in 1884. For many years the desire for greater display had been manifest throughout the order, although the more conservative element had opposed it. A resolution was adopted at the annual convention in 1874 delegating to grand encampments the power to permit encampment members who had taken the Royal Purple degree to wear a uniform for street parades. The wearing of the uniform was optional with the members. The agitation was continued until 1880, when the Sovereign Grand Lodge finally refused to permit the organization of regular uniformed encampments. This refusal resulted in the establishment, a year later, of the Patriarchal Circle, a body composed of Odd Fellows who had taken the Royal Purple degree. This body was inde-

pendent of the Sovereign Grand Lodge and conferred its own degrees. The local organizations were known as 'temples.' The movement spread, and the danger of a schism impelled the Sovereign Grand Lodge in 1884 to yield to the demand for a recognized military degree. The Patriarchs Militant were then organized and the new military degree was approved. Only encampment members who have taken the Royal Purple degree are eligible. The patriarchs have a complete military organization. The subordinate bodies are known as 'cantons,' and each is commanded by a captain. The cantons are organized into battalions, the battalions into regiments, the regiments into brigades, and the brigades into divisions, with officers of corresponding rank. The whole 'army' is commanded by a lieutenant-general, and the grand sire of the Sovereign Grand Lodge is ex-officio general-in-chief.

The Rebekah degree for women members is an important branch of the order. It was established in 1851, and is intended to bring the social benefits of Odd Fellowship within the reach of the female members of the families of living or deceased members of the order. Males are also admitted under the Rebekah degree into the encampment branch of the order.

The symbols in use in the lodges for the purpose of imparting instruction are: the *All-Seeing Eye*, representing the omniscience of God; the *Skull and Cross Bones*, a reminder of mortality; the *Three Links*, representing Friendship, Love, and Truth; the *Scythe*, denoting man's fading character; the *Bow and Arrow and Quiver*, designating the feeling of mutual defense to be cultivated; the *Bundle of Rods*, emblem of strength in union; the *Heart and Hand*, incentives to love and mercy; the *Globe*, man's earthly home; the *Ark of the Covenant*, the repository of God's grace and His goodness to man; the *Serpent*, teaching the wisdom of prudence; the *Scales and Sword*, emblematic of justice; the *Bible*, the source of truth; the *Hour-glass*, the flight of time; and the *Coffin*, emblematic of death.

The emblems in use in the Encampment and Patriarchs Militant are as follows: the *Three Pillars*, representative of Faith, Hope, and Charity; the *Tent*, hospitality; the *Altar of Sacrifice*, reminder of the simple worship offered by the Patriarchs; the *Tables of Stone*, the Ten Commandments; the *Pilgrim's Scrip, Sandals, and Staff*, representing the journey of life; the *Crown*, the Patriarch's power and dignity; and the *Shepherd's Crook and Warrior's Sword*, defense of the helpless.

The emblems of the Rebekah degree are the *Bee Hive*, representing order and industry; the *Dove*, constancy; the *Moon and Seven Stars*, denoting national truth; and the *Lily*, emblem of purity.

The results shown by the records of the order in the fulfillment of the objects of its existence, viz. the visitation of the sick, the relief of the distressed, the burial of the dead, and the education of the orphan, from 1830 to the close of the year 1901, are as follows: There were, besides the Sovereign Grand Lodge, 6 quasi-independent Grand Lodges in foreign countries; 66 Grand Lodges in the United States and Canada; 55 Grand Encampments; 12,792 subordinate lodges; 2780 subordinate encampments; 1,002,272 lodge members; 145,138 encampment members; 40

Rebekah assemblies; 6756 Rebekah lodges; 373,653 Rebekah lodge members; number of members relieved, 2,565,904; and widowed families succored, 256,606. The total revenue for the period was \$240,430,422, and the total expenditure for relief \$92,665,214. The chief officer of the order is known as the Grand Sire.

ODE (Lat. *oda*, ode, from Gk. *ὠδή*, song, from *ἀείδειν*, *aedein*, *ᾄδεν*, *adein*, to sing). Originally, a poem to be sung to the accompaniment of some musical instrument, as the lyre. The poem and the music were inseparable. The simpler form of the Greek ode for a single voice was cultivated by Sappho, Alcæus, Anacreon, and other Æolian poets. The choral ode to be sung, not by a single voice, but by a group, was invented by the Dorians. To Alcman of Sparta belongs the innovation of dividing the chorus into two parts, called the strophe (the turn) and the antistrophe (the counter-turn), in which the performers turn to the right and to the left, the one group answering the other. Stesichorus of Sicily added a third part called the epode (after-song), which was sung by the entire chorus after their movements to the right and to the left. The choral ode, consisting thus of the strophe, the antistrophe, and the epode, was adapted by Simonides of Ceos to the warlike Dorian music. He was followed by Pindar, the greatest lyric poet of Greece. Of Pindar's work there are extant, besides several fragments, forty-four odes of victory, composed for the national games. Each ode has its own complicated metrical structure, corresponding to its own music. The simpler Greek measures were imitated in Latin by Catullus and Horace. See GREEK MUSIC.

The modern ode, dating from the Renaissance, was inspired by Horace and Pindar. It has, of course, undergone many modifications, consequent upon the divorce of verse and musical accompaniment. But it generally shows whence it came by its stanzaic structure and its direct address to some person or object. It is lofty in theme, and more impersonal than the ordinary lyric. Among the first English writers of odes, in imitation of Horace or Pindar, or of both, are Ben Jonson, Crashaw, Milton, Cowley, Marvell, Dryden, Collins, and Gray. Marvell's ode on the return of Cromwell from Ireland is one of the best in the Horatian manner; but Gray best understood Pindar. Gray divides his *Progress of Poesy* into three stanzas, each having forty-one lines; each stanza is further divided into strophe, antistrophe, and epode; and the three parts of each stanza are identical in form. Collins, with admirable art, employed a less elaborate structure, and most English poets have followed him rather than Gray. Indeed, the ode as now written is only a succession of stanzas in lines of varying length and metre. These stanzas, in verse and rhyme, may pursue either a regular or an irregular order, so falling into one or the other of the two great classes into which modern odes are divided. Each type creates its own specific forms, which in either case may be of an almost endless variety; but in the regular ode the stanzaic form is either the same from stanza to stanza, or varies according to a fixed principle, while in the irregular ode the form is determined solely by the poet's varying mood and alters in the freest manner

from verse to verse and from stanza to stanza. The irregular ode is thus the most purely subjective of lyric forms and capable of the most delicate adjustments of music and mood; but, because of its very pliancy, it is also perhaps the one form in which success is least often attained. Of musical settings for odes the most famous are those of Purcell, twenty-eight in number, and the four by Handel.

Among the great English odes of the nineteenth century are Wordsworth's *To Duty* and *Intimations of Immortality*; Coleridge's *To France*; Shelley's *To the West Wind*, *To Liberty*, *To Naples*, and *To a Skylark*; Keats's *To a Nightingale*, *To Autumn*, and *On a Grecian Urn*; Tennyson's *On the Death of the Duke of Wellington*; and Swinburne's *To Victor Hugo*. Among those produced in the United States there are Bryant's *To a Waterfowl*, *The Winds*, and *Hymn of a City*; and Lowell's great *Commemoration Ode* to those who fell in the Civil War. As an occasional poem addressed to a friend, the ode is cultivated by many poets on both sides of the Atlantic. Consult: *English Odes*, selected (London, 1881); *Great Odes, English and American*, selected by Sharp (Canterbury Poets); and for more recent odes, the poems of Coventry Patmore and William Watson. See also the various poets mentioned in this article, and LYRIC POETRY.

ODELL, BENJAMIN B., Jr. (1854—). An American political leader, born at Newburg, N. Y. He studied at Bethany College, W. Va., spent three years at Columbia, and then entered business and politics almost simultaneously. He became a member of the New York State Republican Committee in 1887, and chairman of the Executive Committee in 1896. From 1895 to 1901 he was a member of Congress, and was chairman of the Committee on Accounts during the Fifty-fifth Congress. In 1900 he was elected Governor of New York, and signalized his administration by cutting down the expenses of government through the application of 'business principles.' This and his attitude toward Senator Thomas C. Platt, head of the New York Republican organization, made Odell a conspicuous national figure. In 1902 he was reelected Governor.

ODELL, JONATHAN (1737-1818). An American loyalist poet, born in Newark, N. J., September 25, 1737. After graduating in 1754 at the College of New Jersey in Newark, he studied medicine, and was a surgeon in the British Army. In 1766 he took orders and shortly after became rector of the church at Burlington, N. J. He was devoted to the loyalist cause during the Revolution, was driven out, and on the evacuation of New York went to England; but he returned to America and filled positions in the Council of the Province of New Brunswick. He died in Fredericton, N. B., November 25, 1818. Odell is chiefly known as the most effective satirist on the Tory side and also for strong odes and other lyrics. He shares the honors of Tory laureate with Joseph Stansbury, with whose verses his own were collected in 1860 by Winthrop Sargent.

OD'ENATHUS. King of Palmyra and husband of the celebrated Zenobia. See PALMYRA; ZENOBIA.

ÖDENBURG, Öden-böörk (Hung. *Soprony*). A royal free city and capital of the county of the same name in Hungary, situated a short distance from the Neusiedler See and 53 miles by rail southeast of Vienna (Map: Hungary, E 3). It is a fine town with a number of interesting churches and monasteries, a theatre, a casino, a higher gymnasium and *Realschule*, a Protestant lyceum, and a number of other educational establishments. The vicinity of Oedenburg has long been famous for its wine and fruit. The manufactures of the town include sugar, spirits, preserved fruit, agricultural implements, wagons, etc. The trade is mostly in agricultural products. Oedenburg is identified with the Roman *Scarabantia*. Population, in 1900, 33,478, mostly German Catholics.

ODENHEIMER, Ö'den-hi'mër, WILLIAM HENRY (1817-79). A bishop of the Protestant Episcopal Church. He was born in Philadelphia, graduated from the University of Pennsylvania in 1835, and was ordained priest in 1841. His sole ministerial charge was Saint Peter's, Philadelphia, where he was considered one of the model parish priests of the United States. In 1859 he was consecrated third Bishop of New Jersey. At the division of the State into two dioceses he chose that of Northern New Jersey. He was the author of *The Origin and Compilation of the Prayer-Book* (1841); *The True Catholic No Romanist* (1842); and *Canon Law* (1847). He died at Burlington, N. J. Consult the volume of his sermons with introductory memoir by his widow (New York, 1881).

ODENKIRCHEN, Ö'den-kërk'en. A town in the Rhine Province, Prussia, on the Niers, 25 miles northwest of Cologne (Map: Prussia, E 3). It has manufactures of velvets, silks, leather, harness, and sealskin. Population, in 1900, 14,746.

ODENSE, Ö'den-sä. The largest city on the island of Fünen, Denmark, capital of Odense Amt, constituting the northern half of the island, and the third city in population in the Kingdom. It is situated on the Odense River near its mouth in the Odense Fiord (Map: Denmark, D 3). Its streets are well paved, and the city has many handsome modern houses. It is lighted by gas and electricity, and was the first city in Denmark to have water distributed to the houses through pipes. The most notable building is the Cathedral of Saint Canute, built in the thirteenth century, the best example of Gothic architecture in Denmark. Here are buried several distinguished Danish monarchs. The Church of Our Lady, built in the twelfth century, is the oldest edifice in the town. Other buildings worthy of note are the Odense Castle, erected by Frederick IV., and surrounded by a beautiful park, the large monumental city hall, and the new post-office. The chief educational institutions are a seminary, a technical and an agricultural school, two libraries of 36,000 volumes each, and an archaeological museum.

The city is of great industrial and commercial importance. The chief industrial establishments are breweries, distilleries, glass, chemical, and tobacco factories, machine shops, textile mills, and sugar refineries. The harbor consists of two elongated basins forming the forked extremity of the Odense Ship Canal, opening into the fiord. Further improvements and extensions are now

being made, and the town is the chief railroad and commercial centre of Fünen, exporting butter, cheese, hides, and bacon in considerable quantities. The population has increased sevenfold during the past century. In 1890 it was 30,277, and in 1901, 40,138.

Odense dates from the legendary period of Danish history. It became a bishop's see early in the eleventh century, and several councils of archbishops were held here. In the sixteenth century the city was the meeting place of several parliaments. It suffered severely during the Swedish occupation in 1658-60. Odense is the birthplace of Hans Christian Andersen.

ODENWALD, *ö'den-vält*. A mountain region in Southern Germany, covering parts of Hesse and Northern Baden. It lies east of the Rhine, between the Main and the Neckar, the latter separating it from the northern extension of the Black Forest, and the former from the Taunus Range (Map: Germany, C 4). The eastern part, which consists mainly of sandstones, is the more level, and slopes gradually toward the plain. The western part consists of granite, gneiss, and crystalline slate, and falls abruptly toward the Rhine Valley. There are many beautiful valleys, and several peaks reaching a height of about 2000 feet. Large portions are covered with magnificent beech and oak as well as pine forests, and the region is dotted with castles and ruins possessing historical and legendary associations.

ODÉON, *o'dá'ón'*. A theatre in Paris, opposite the gardens of the Luxembourg Palace, ranking next to the Théâtre Français, and receiving an annual Government subvention of 100,000 francs. It is given over chiefly to classical dramas. The theatre was erected in 1782 and has been several times destroyed by fire and restored under various names.

ODER, *ö'dér*. One of the principal rivers of Germany (Map: Germany, F 2). It rises on a southern extension of the Sudetic Mountains, near Olmütz, in Moravia, and flows in a generally northwest direction through Prussian Silesia, Brandenburg, and Pomerania. It empties into the Stettiner Haff, from which its waters flow into the Baltic Sea through three arms which form the islands of Usedom and Wollin. Its length is 562 miles. Only in its extreme upper course does it flow through a hilly and forested country; for the greater part of its length its banks are low and flat, often marshy, and in some places diversified with sand dunes. In its lower course it divides repeatedly into parallel arms, which in the last twenty miles form a long, narrow delta. The river is in general shallow, and the current is very swift and there are sudden and great variations in volume. Extensive and costly engineering works have been necessary to confine it to its bed and render it navigable, but in dry summers navigation is still uncertain. The total navigable length for small vessels is 445 miles, ending at Ratibor, in Southern Silesia. Sea-going vessels can ascend as far as Stettin, at the head of the Stettiner Haff, but the chief port used by ocean commerce is Swinemünde, on the central outlet into the Baltic. The principal tributary of the Oder is the Warthe, which rises in Poland and nearly equals the main river in size. The chief cities on the Oder are Stettin, Frankfort (Brandenburg), Breslau, and Oppeln. Consult: *Der Oderstrom, sein Stromgebiet und*

seine wichtigsten Nebenflüsse (Berlin, 1896); Brämer, "Die Oder und ihr Gebiet," in *Zeitschrift des königlichen preussischen Statistischen Bureau*s (Berlin, 1899).

ODESSA. The most important city and seaport of Southern Russia and the fourth city of the Empire in population, situated in the Government of Kherson, on an elevation sloping toward an inlet of the Black Sea (Map: Russia, D 5). It lies about 32 miles northeast of the mouth of the Dniester and 938 miles by rail southwest of Moscow. The general appearance and atmosphere of Odessa are rather European than Russian. The climate is temperate, the annual temperature being about 50° F., ranging from 70° in July to about 26° in January. The city was built up during the nineteenth century, and is therefore one of the youngest among the large cities of Russia. It is regularly laid out around the bay and has a number of fine streets and squares, from which a magnificent view of the sea is obtained. The most popular boulevard is the Nikolayevsky Boulevard, from which a grand stairway leads to the bay. At the head of the stairway is the bronze statue of the Duc de Richelieu, the first Governor of the district, to whom Odessa owes much of its progress and architectural beauty.

There are many fine buildings, both ecclesiastical and secular. The chief among them are the cathedral, the exchange, the theatre, the Governor's palace, the city hall, the municipal library, containing 80,000 volumes, and the university building. Monuments to Alexander II., Catharine II., and Pushkin adorn various sections of the town. There are about twenty-five orthodox churches, a number of monasteries, synagogues, and a few reformed churches. In the southern and eastern parts of the city are situated a number of parks, among which the chief are the Alexandrovsk Park and the Botanical Garden. At the head of the educational institutions is the university ('Novo-Rossiiskiy Universitet'), founded in 1864, and having faculties of medicine, philosophy, law, history and philology, physics and mathematics. The number of its students is about 700. It has a library of over 130,000 volumes, a museum, and an observatory. There are a number of gymnasias and preparatory, commercial, art, and industrial schools. Odessa has various learned societies, four theatres, and a number of philanthropic institutions. The city is lighted by gas, and the port mainly by electricity. Water is conducted from the Dniester, a distance of over 26 miles. The harbor is modern and very extensive. It is of sufficient depth for the admission of deep-draught vessels. It is divided by large moles into several ports.

While Odessa is primarily a commercial place, it is also of considerable industrial importance. In 1899 it had over 500 large industrial establishments, employing about 21,000 persons, and with an output of over \$30,000,000. The chief establishments are flour mills, sugar refineries, match factories, breweries, tanneries, soap factories, iron works, etc. Situated on the coast of one of the largest grain-producing areas of Russia and in close proximity to the estuaries of the Dnieper and the Dniester, the city is naturally well equipped for its position as the chief grain-exporting centre of Russia, and the first

port of Russia in regard to exports in general. Of the annual exports of over \$50,000,000, grain, mainly wheat, forms from 65 to 75 per cent. The remainder consists of animals and animal products, sugar, and lumber. The imports, valued at about \$25,000,000, consist of machinery, coal, chemicals, and various manufactured products. In its imports Odessa is exceeded only by Saint Petersburg and Reval. At the head of the administration of the city is the prefect, or gradonatchalnik, appointed by the central Government. The municipal assembly, or дума, consists of 60 members, elected by all citizens owning real estate. The mayor is elected by the city council. The budget of the city balances at about \$2,000,000. For further details as to municipal government, see article RUSSIA, section on *Government*.

The environs of Odessa are very picturesque and offer numerous seacoast resorts. The three salt-water lakes, or limans, Kuyalnik, Khadjibey, and Klein Liebenthal, are much frequented by invalids.

The population increased with remarkable rapidity during the last century. The first settlers were mostly Greeks, Italians, and Albanians, and in 1802 numbered 9000. In 1901 the population was 450,218, of whom nearly one-third were Jews. The foreign population is about 30,000.

Odessa takes its name from the Greek settlement, Odessus, which existed here in ancient times. In the fifteenth century the Turks constructed on the present site the fortress of Khadjibey, which was taken by the Russians in 1789. In 1793 the place was fortified by the Russians and a year later received its present name. The growth of the town was fostered by Paul I. and by the wise and beneficent administration of the Duc de Richelieu. In 1817 it was declared a free port, and this decree, remaining in force till 1859, made possible Odessa's commercial supremacy in Southern Russia. In 1854 it was bombarded by the allied English and French naval forces.

ODE'UM (Lat., from Gk. *ὀδεῖον*, *odeion*, from *ὀδῆ*, *odē*, song). The Greek name for a public building devoted to musical performances. The earliest Odeum in Athens seems to have been built by Pericles, and was a circular building with a conical roof in imitation of the tent of Xerxes. It had many pillars within, and thus did not resemble the theatre. It was intended for the musical competitions at the Panathenæa, but was later used for other purposes. It was burned during Sulla's siege of Athens (B.C. 86), but was soon rebuilt by Ariobarzanes II., King of Cappadocia. In Roman times the name was employed to designate a small theatre, with a roof, and such buildings became common in Grecian cities. In Athens there were two: one erected by Agrippa, near the market; the other, of which the walls still remain, at the southwest of the Acropolis, built by Herodes Atticus shortly after A.D. 160 in memory of his wife, Regilla. Consult Dörpfeld, "Die verschiedenen Odeen in Athen," in *Mittheilungen des deutschen archäologischen Instituts in Athen*, vol. xvii. (Athens, 1892).

O'DIN (Icel. *Óðinn*, AS. *Wōden*, OHG. *Wuotan*; probably connected with Goth. *wōds*, possessed, AS. *wōd*, OHG. *wuot*, frenzied, Ger. *Wut*, frenzy, OIr. *faith*, Lat. *vates*, poet). The chief

god of Northern mythology. According to the sagas, Odin and his brothers, Veli and Ve, the sons of Boer, or the first-born, slew Ymir or Chaos, and from his body created the world, converting his flesh into dry land; his blood, which at first occasioned a flood, into the sea; his bones into mountains; his skull into the vault of heaven; and his brows into the spot known as *Midgard*, the middle part of the earth, intended for the habitation of men. Odin rules heaven and earth, and is omniscient. His seat is Valaskjalf, from whence his two black ravens, Hugin (Thought) and Munin (Memory), fly daily to gather tidings of all that is being done throughout the world. As god of war, he holds his court in Valhalla, whither come all brave warriors after death to revel in the tumultuous joys in which they took most pleasure while on earth. His greatest treasures are his eight-footed steed Sleipner, his spear Gungner, and his ring Draupner. By drinking from Mimir's fountain he became the wisest of gods and men, but he purchased the distinction at the cost of one eye. Frigga is his queen, and the mother of Balder, but he has other wives and favorites, and numerous sons and daughters.

O'DO, or EUDES, *ed*, OF BAYEUX (c.1036-97). The half-brother of William I. of England. He was made Bishop of Bayeux about 1049. He took part in the Norman conquest of England in 1066, and received the earldom of Kent; but it is possible that he never received the title of earl. During William's absence from England in 1067 he was one of the two regents and seems to have ruled very tyrannically. Later he fell under William's displeasure and was imprisoned for over four years. He was released by William Rufus, against whom he rebelled in 1088 and was consequently banished from England. He died at Palermo in 1097, while on his way to join the crusading armies. Consult Freeman, *Norman Conquest*, vol. iv. (Oxford, 1871).

ODO, or EUDES, or PARIS (c.857-98). King of France from 888 to 898. He was the son of Robert the Strong, progenitor of the Capetians. Odo was Duke of France, Count of Paris, and the defender of the city during the siege by the Northmen in 886. His father's popularity and his own valor caused him to be chosen King of the West Franks in 888, after the deposition of Charles the Fat. His reign was troubled by rebellions on the part of the supporters of Charles the Simple, the Carolingian heir. Odo kept the kingdom, but before his death, January 1, 898, recommended his followers to recognize Charles as his successor.

OD'OA'CER, or OD'OVA'CER (?-493). Ruler of Italy from 476 to 493. He was the son of *Edico*, a noble of the race of the Scyrii, and saw his first military service probably in the army of Orestes, father of the young Romulus Augustulus, last Emperor of the West. Odoacer perceived the weakness of the new ruler, and resolved to profit by it. He had little difficulty in persuading the barbarian soldiery that Italy belonged to them, and in their name demanded of Orestes the third part of the land as the reward of their help. Orestes refused; and Odoacer, at the head of his Scyrii, Herulians, Rugians, and Turcilingians, marched against Pavia, which Orestes had garrisoned, stormed the city, and put his opponent to death (476). Romulus abdi-

cated and withdrew into obscurity. Odoacer showed himself to be wise, moderate, and politic. He took the title of king only, and caused the Senate to dispatch to Constantinople a flattering letter, in which it declared one Emperor to be enough for both East and West, renounced its right of appointing the emperors, expressed its confidence in the civil and military talents of Odoacer, and begged Zeno to confer upon him the administration of Italy. After some hesitation the Byzantine Emperor yielded to the entreaties of the Senate, and Odoacer received the title of Patricius. This is commonly taken as the date for the fall of the Western Empire.

Odoacer fixed his residence at Ravenna. According to his promise, he divided among his companions the third part of the land of Italy—a measure far less unjust than at first sight may seem, for the peninsula was then almost depopulated, and many domains were lying waste. He maintained peace throughout the peninsula and conquered Dalmatia. In matters of religion, though an Arian himself, he acted with great impartiality; nevertheless he was intensely hated by the native Italians. The success of Odoacer excited the jealousy and alarm of Zeno, the Emperor of the East, who encouraged the Ostrogoth King, Theodoric (q.v.), to undertake an expedition against Italy, hoping at the same time to get rid of the Goths, who were a menace to Constantinople. The first battle was fought on the banks of the Isontius (the modern Isonzo) in 489. Odoacer was beaten, and retreated. During his retreat he hazarded another battle at Verona and was again beaten. He now hastened to Rome to rouse the inhabitants, but the gates of the city were closed against him. Returning northward to his capital, Ravenna, he reassembled the wrecks of his army, and in 490 once more marched against the Ostrogoths, whose advance guard he defeated and pursued to the walls of Pavia. Another great battle now took place on the banks of the Adda, when Odoacer was vanquished for the third time. He now shut himself up in Ravenna, where Theodoric besieged him for three years. Odoacer then capitulated, on condition that the Kingdom of Italy should be shared between him and Theodoric. This agreement was solemnly sworn to by both parties, February 27, 493; but on March 5th Odoacer, invited to a banquet by Theodoric, was killed by the Gothic King's own hand. Consult: Pallmann, *Geschichte der Völkerwanderung* (Gotha, 1863); Hodgkin, *Italy and Her Invaders*, vol. iii. (Oxford, 1885); and Dahn, *Könige der Germanen*, vol. ii. (Munich, 1861).

ODOMETER (from Gk. *ὁδός*, *hodos*, road + *μέτρον*, *metron*, measure). An instrument used in connection with a vehicle or other wheel for measuring lengths of road or other distances. The odometer consists of a series of gear wheels so arranged that the first and smallest wheel revolves either once or some definite fraction of a revolution for every revolution of the vehicle wheel to which it is attached. This is usually accomplished either by a star wheel with which a projection on or near the hub of the vehicle comes in contact, or some similar device. As the circumference of the wheel can readily be measured, it is, of course, possible to arrange the gear wheels so that there will be recorded finally and shown by dials or other indicators the distance in feet, yards, miles,

or kilometers. The odometer, which was at one time used but rarely except by road surveyors, especially in preparing county maps, is extensively employed with bicycles and automobiles, and in this form is known as a cyclometer. It is a very convenient instrument in a rough survey or reconnaissance where it is necessary to measure certain distances along a road, as it can be attached to the axle of a wagon or bicycle and readings made from time to time by the observer between points on the same line.

OD'ONATA (Neo-Lat., from *ὀδόντης*, *odous*, tooth). An order of insects comprising the dragon-flies. See **DRAGON-FLY**.

O'DON'NELL, LEOPOLD (1809-67). Duke of Tetuan. A Marshal of Spain. He was born at Santa Cruz, Teneriffe, of an Irish family long in the service of Spain. He entered the army when young and embraced the cause of Isabella (q.v.) against Don Carlos, whose armies he fought bravely under Espartero, gaining the title of Count of Lucena. In 1840 he sided with Maria Christina, the Queen mother, went with her to France, and stirred up a number of unsuccessful revolts against Espartero, his old chief. In 1843 his intrigues were more fortunate, Espartero fell, and O'Donnell went to Cuba as Governor-General. Returning rich in 1848, he plotted against the Ministers, Bravo-Murillo and Narvaez. In 1854 he headed a military insurrection; defeated and driven into Andalusia, he suddenly turned Liberal, issued a radical manifesto, and gave his rising the aspect of a revolution. He won. The nation and Espartero joined him, the two men assumed the powers of government, and O'Donnell was made Marshal. Then by a *coup* O'Donnell ousted Espartero, July, 1856, but in three months was himself ousted by Narvaez. He resumed office in 1858, and in the following year led as Prime Minister and commander-in-chief a successful expedition against the Moors and was made the next year Duke of Tetuan. He resigned in 1863, but was recalled in 1865, and remained Prime Minister till 1866. He died the next year at Bayonne.

O'DONOGHUE, ḏ-dōn'ō-hy, DAVID J. (1866—). A British biographer and editor, born in Chelsea, London. He was educated in a Roman Catholic school, and began his journalistic work by writing for the Dublin papers upon subjects relating to Irish music, art, and literature. A founder of the Irish Literary Society in London, he was also vice-president of the National Literary Society, Dublin, and the compiler of a biographical dictionary called *The Poets of Ireland* (1891-93); also, *Humor of Ireland* (1894); *List of 1300 Irish Artists* (1894); *Traits and Stories of the Irish Peasantry* (4 vols., 1896-97); *Bibliographical Catalogue of Collections of Irish Music* (1899); and a *Treasury of Irish Poetry in the English Tongue* (1900). He edited the works of Samuel Lover (1898-99), and among his biographies are those of *William Carleton* (1896); *Richard Pockrich, an Irish Musical Genius* (1899); and *Robert Emmet* (1902).

O'DONOJÚ, ḏ-dō'nō-hōō', JUAN (c.1755-1821). A Spanish soldier and viceroy, born in Spain. Already well known in his own country, he was made acting Viceroy of Mexico in 1821. When he arrived there he found that Iturbide was practically conqueror of the entire province and that there was little left for him to do but

make terms with the victorious revolutionist. He signed the Treaty of Córdoba, which made Mexico an empire, and surrendered the city itself (1821). Meanwhile he was elected one of the provisional agents, and died soon after.

O'DONOVAN, JOHN (1809-61). A distinguished Irish historian, archæologist, and Gaelic scholar. He was born in Attateamore, County Kilkenny. In 1826 he obtained work in the Irish Record Office, and in 1829 was appointed to a post in the historical department of the Ordnance Survey. In the discharge of his office he examined many Irish manuscripts and visited every part of the country, thus becoming an authority on Irish topography. In 1840 the Irish Archæological Society was formed, and in the following year O'Donovan contributed a map of ancient Ireland to its first volume of publications. From this time till the year of his death he was a prolific writer on Irish history and antiquities. He was called to the Irish bar in 1847, having entered at Gray's Inn three years before. O'Donovan's chief work was an edition of the so-called *Annals of the Four Masters*, a compilation made in the seventeenth century by Michael O'Clery and a company of Irish Franciscans. This was finished in 1851, and the next year O'Donovan was employed by the commission for the publication of the ancient laws of Ireland. He made extensive manuscript collections for an edition of the *Seanchus Mor*, but did not live to prepare them for publication. In 1845 he published a *Grammar of the Irish Language* which was long regarded as the chief authority on the subject. Of O'Donovan's remaining works the most important were issued by the Irish Archæological Society or the Celtic Society.

ODONTOLCÆ. See BIRD, FOSSIL.

ODONTOLOGY. See DENTISTRY; TEETH.

O'DONTOR/NITHES. A group-name for all those primitive birds which had teeth in the jaws (bill). See BIRD, FOSSIL.

O'DWYER, JOSEPH (1841—). An American physician, specialist in the diseases of children. He was born in Summit County, Ohio; graduated at the New York College of Physicians and Surgeons; and became a practicing pediatricist in New York City. O'Dwyer invented, in 1885, intubation of the larynx to take the place of tracheotomy. The method was very successful, especially in croup and diphtheria.

ODYNIEC, ó'du'né-ěts, ANTONI EDWARD (1804-85). A Polish poet and critic, best known for his close relations with Mickiewicz. He was born in Lithuania; studied at Vilna; and, settling at Warsaw, became editor of *Melitele*, a periodical which reflected the aims of the young Romantics of the time. He had already written translations from the German, especially Bürger, and the two volumes of romantic verse entitled *Poezye* (1825). After several years in Dresden and Leipzig, he returned to Vilna in 1837 and for twenty years was editor of *Kurjer Wileński*, an official journal. His dramas include: *Felicyta* (1849), dealing with the early Christian martyrs; and *Barbara Radziwiłłówna* (1858), an historic piece of the time of Sigismund Augustus. *Listy z podróży* (1875-78) tells of his travels with Mickiewicz.

ODYSSEUS. See ULYSSES.

ECOLAMPA'DIUS, JOHANNES (1482-1531).

One of the most eminent of the coadjutors of Zwingli in the Swiss Reformation. The name Ecolampadius is a Græcized form, after the fashion of the time. His real name is variously given as Heussagen, Hüsgen, Hausch, and Huschke; at any rate it was not Hausschein, as has been inferred from the meaning of Ecolampadius. He was born in 1482 at Weinsberg, Württemberg. He first studied at Heilbronn, then at Heidelberg, where he took his B.A. and M.A. (1501), and altered his name as many scholars of the age did. His father desiring him to study law, he repaired to Bologna to hear a certain famous professor, but, the climate not agreeing with him, he returned in six months to Heidelberg and studied theology, which was his personal preference. After a while he returned home, but, again in pursuit of knowledge, he went to Tübingen (1512) and studied Greek at Stuttgart under Reuchlin, and Hebrew under the Spanish physician Matthew Adrian, at Heidelberg. In 1516 he began preaching at Basel, where he formed the acquaintance of Erasmus, who highly appreciated his classical attainments and secured his assistance in his edition of the New Testament. In 1518 he was preaching at Augsburg, and in 1520 entered the Brigittine convent at Altmünster, near Basel. But Luther's publications exercised so great an influence on him that he left the convent in 1522 and became chaplain to Franz von Sickingen, after whose death he returned to Basel in November, 1522, and, in the capacity of preacher and professor of theology, commenced his career as a reformer. In the controversy concerning the Lord's Supper, he gradually adopted more and more the views of Zwingli, and at last maintained them in 1525, in a treatise, to which the Swabian ministers replied in the *Syngramma Suericum*. In 1529 he disputed with Luther at Marburg. He died at Basel, November 24, 1531. There is no collected edition of his writings. Consult his *Life* by Herzog (Basel, 1843), and by Hagenbach (Elberfeld, 1859).

ECOLOGY. See ECOLOGY.

ECUMENIUS, ek'ú-mé'n-ús. A theological author of the tenth century. He was for some time Bishop of Tricca, in Thessalia, and is supposed to have written the following Greek commentaries to the New Testament: 'Εξηγήσεις εἰς τὰς Παύλον ἐπιστολὰς πάσας (a commentary on all the Epistles of Saint Paul); 'Εξηγήσεις εἰς τὰς πράξεις τῶν Ἀποστόλων (a commentary on the Acts of the Apostles); 'Εξηγήσεις εἰς τὰς ἐπτὰ καθολικὰς λεγόμενας ἐπιστολὰς (a commentary on the seven Epistles termed Catholic); and *Commentaria in Sacrosancta Quatuor Christi Evangelia*, published by Hentenius in 1641, but now generally ascribed to Euthymius Zygadenus. The Greek text of this last commentary was published by C. F. Matthæi (Leipzig, 1792), and a complete edition of all Ecumenius's writing was published, in both Latin and Greek, in Paris in 1631.

CEDEMA (Neo-Lat., from Gk. *οἰδήμα*, *oidēma*, swelling, from *οἰδν*, *oiden*, to swell, from *οἶδος*, *oidos*, swelling). The term applied in medicine to the swelling occasioned by the effusion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common, but is not the only

seat of this affection. It is occasionally observed in the submucous and subserous cellular tissue, and in the cellular tissue of the parenchymatous viscera; and in some of these cases it gives rise to symptoms which admit of easy recognition during life. Thus œdema of the glottis (see LARYNX, Diseases of) and œdema of the lungs constitute well-marked and serious forms of disease; while œdema of the brain, though not easily recognized during life, is not uncommonly met with in the post-mortem examination of insane patients. A general œdema is called *anasarca*.

Œdema may be either passive or active, the former being by far the most common. *Passive œdema* arises from impeded venous circulation (as from obstruction or obliteration of one or more veins; from varicose veins; from standing continuously for long periods, till the force of the circulation is partly overcome by the physical action of gravitation; from deficiency in the action of the adjacent muscles, which in health materially aids the venous circulation, etc.); from too weak action of the heart (as in dilatation or certain forms of valvular diseases of that organ); or from an impoverished or toxic state of the blood (as in chlorosis, scurvy, Bright's disease, etc.). By means of the knowledge derived from pathological anatomy, we can often infer the cause from the seat of the swelling; for example, œdema of the face, usually commencing with the eyelids, is commonly caused by obstruction to the circulation through the left side of the heart, or by the diseased state of the blood in Bright's disease; and œdema of the lower extremities most commonly arises from obstruction in the right side of the heart, unless it can be traced to the pressure of the gravid uterus, or of accumulated feces in the colon, or to some other local cause.

Active œdema is associated with an inflammatory action of the cellular tissue, and is most marked in certain forms of erysipelas. It is firmer to the touch, and pressure with the finger produces less pitting than in the passive form.

Angio-neurotic œdema is an affection of neurotic origin characterized by transient, circumscribed swellings in different parts of the body, which come and go suddenly. They may appear on the face and involve a single eyelid or the nose. The larynx may become swollen and cause death.

Malignant œdema is due to a specific infection, the bacillus of which is found in earth. It is rapidly fatal. See ANTHRAX.

From the preceding remarks, it will be seen that œdema is not a disease, but a symptom, and often a symptom indicating great danger to life. The means of removing it must be directed to the morbid condition or cause of which it is the symptom. See DROPSY.

ŒDENBURG, *Œden-böörk*. A royal free city of Hungary. See ŒDENBURG.

ŒDIPUS (Lat., from Gk. *Οἰδίπους*, *Oidipous*, *Οἰδιπόδης*, *Oidipodēs*; according to the popular etymology from *οἰεῖν*, *oidein*, to swell + *πούς*, *pous*, foot). The hero of one of the most famous Theban legends. The story was certainly told in the early epics, one of which bore the title *Œdipodea*, and it is briefly indicated in the *Odyssey*, but for us it is known chiefly through the plays of the Athenian tragedians, especially Sophocles. The earlier versions, which

seem to have varied in many and not unimportant details, are all lost, and though many hints can be obtained by careful analysis of later chroniclers and commentators, any complete reconstruction of the lost poems is in the highest degree conjectural. After passing through the hands of the dramatists, it assumed the following form: Laius, son of Labdacus, King of Thebes, was warned by Apollo's oracle at Delphi that he was to die at the hands of his son. In spite of this warning, Laius became by his wife Jocasta the father of a boy. No sooner was the child born than he fastened its ankles with a pin (whence the name 'swell-foot') and gave it to a faithful herdsman to expose on Mount Cithæron. Ignorant of the oracle, the man in pity gave the child to the shepherd of Polybus, King of Corinth, and that ruler, who was childless, reared him as his own son. The young man, Œdipus, never doubted his Corinthian origin till the taunt of a drunken companion roused his suspicions, and, unable to obtain satisfaction from his supposed parents, he sought the oracle at Delphi, which did not answer his question, but warned him that he was doomed to slay his father and wed his mother. Horrified, Œdipus fled away from Corinth, and shortly after met Laius with his servants. They endeavored to force him from the road, and in the quarrel he slew them all, as he supposed. Pursuing his journey, he found Thebes harassed by the Sphinx, who propounded a riddle to every passer-by and devoured all who failed to solve it. Creon, the brother of Jocasta, who had become King on the death of Laius, had offered the hand of his sister and the kingdom to him who, by solving the riddle, should free the city from the monster. Œdipus answered the riddle and thus slew the Sphinx. He then married Jocasta, his mother, and became King of Thebes. At first he prospered greatly, and four children were born to him, two sons, Eteocles and Polynices (q.v.), and two daughters, Antigone (q.v.) and Ismene. At length a terrible pestilence visited Thebes, and the oracle declared that the murderer of Laius must be exelled from the country. Œdipus began the search, and by degrees the truth became known. Jocasta hanged herself and Œdipus put out his eyes. The later fate of the King was told in varied form. His sons by their deeds brought upon themselves his curse, and ultimately fell by each other's hand. Œdipus himself was driven from Thebes, and, attended by his faithful daughter, Antigone, wandered over the earth, till he reached the grove of the Eumenides (q.v.), at Colonus, near Athens. Chastened by his sufferings, he was received by these dread goddesses, and conducted, some said, without death to the other world.

For the legend in its varied forms, consult the Introductions in Jebb's editions of the *Œdipus Tyrannus* and *Œdipus Coloneus* of Sophocles (Cambridge, 1893-99); also U. von Wilamowitz-Möllendorf, *Griechische Tragödien*, vol. i. (Berlin, 1899). For the epic forms, see Bethe, *Thebanische Heldenlieder* (Leipzig, 1891). The other extant Greek plays which touch upon the general subject are Æschylus, *Seven Against Thebes*; Sophocles, *Antigone*; Euripides, *Phæniçæ*.

ŒDIPUS COLONEUS (Lat., from Gk. *Οἰδίπους Κολώνεος*, *Oidipous Kolōneios*, Œdipus of

Colonus). A tragedy by Sophocles, produced in B.C. 401 after the author's death. The action takes place in the grove of the Eumenides at Colonus, whither the blind Œdipus is led by his daughter Antigone, and where he is to die. Creon attempts to induce Œdipus to go with him, and, failing, carries off Antigone and Ismene, who are rescued by Theseus, King of Athens. Polynices appears and is cursed by his father. Finally Œdipus withdraws into the grove and his death is announced. The tragedy is simple in plot and filled with an atmosphere of peace and dignity, except in the scenes with Creon and Polynices.

ŒDIPUS TYRANNUS (Lat., from Gk. *Oidipous tyrannos*, *Oidipous tyrannos*, Œdipus the King). The greatest drama of Sophocles and the most representative of Greek tragedies. The scene is Thebes, which has been visited by a pestilence, and can be cleansed only by the punishment of the murderer of Laius, on whom Œdipus invokes curses. The plot consists in the gradual bringing home to Œdipus that he is the unwilling murderer of his father and the husband of his own mother. In the horror of the enlightenment, Jocasta kills herself and Œdipus in frenzy blinds himself and begs of Creon to banish him. The dialogue is full of life, the interest of the action is sustained throughout, and the choral portions are of notable beauty.

ŒEHLENSCHLÄGER, ʔ'en-shlä'gër, ADAM GOTTLÖB (1779-1850). A great Danish poet and dramatist, born of German ancestry at Vesterbro, near Copenhagen. He was irregularly educated; was destined first for trade, then for the university, and then went on the stage. After failure as an actor he studied law, but in 1802 he quitted law to devote himself to literature. In the symbolic poem *Guldhornene* he declared his new faith, destroyed older verses then in the printer's hands, and composed in haste new ones in their place that made him undisputed head of the new Romanticists. From 1805 to 1809 he traveled on a Government stipend, visiting Goethe, Madame de Staël, and other noted writers. In 1810 he was made professor of æsthetics at Copenhagen, but did not long retain this position. In 1829 he was crowned by Tegnér as King of the Singers of the North. He was similarly honored at the royal palace in Copenhagen in 1849, and his funeral, two months later, was made a national solemnity. Œehlenschläger's importance lies in drama, beginning with *Sanct Hans Aften-Spil* (1803), followed by a series of national tragedies, *Hakon Jarl* (1807; English trans. 1875), *Baldur hin Gode*, *Karl den Store*, *Palnatoke*, *Azel og Yalborg*, *Væringerne i Miklagard*, and thirteen others, together with five of a more general character, of which the first, *Correggio* (German, 1807; Danish, 1811; English trans., 1854), is typical. Œehlenschläger's dramas, like those of other Romanticists, show epic and lyric rather than dramatic qualities. They are genuinely national, most of them rooted in the popular sagas, and they show unrivaled command of language. Through them he gave the *Eddas* new life. By his youthful *Poems* (1805) he revealed unexpected lyric possibilities in the Danish language. Of these poems perhaps the dramatic fairy tale *Aladdin* is most significant. His later lyric and epic work is not of great value, except *Nordens Guder* (*Gods of the North*, 1819), an effort to utilize Norse myth-

ology for modern poetry. Œehlenschläger's *Works* are in 26 volumes, comprising dramas, memoirs, miscellaneous prose and verse (Copenhagen, 1851-54). For his life consult Arentzen (Copenhagen, 1879) and Nielson (ib., 1879).

ŒEHLER, ʔ'ër, GUSTAV FRIEDRICH (1812-72). A German theologian. He was born at Ebingen, Württemberg. In 1834 he became teacher in the Missionary Institution of Basel, which he left in 1837 to study Oriental languages at Berlin. The same year he went to Tübingen as *repetent*. In 1840 he became professor in the seminary at Schöndal and remained until 1845, when he accepted a call to Breslau. He opposed the union of the Lutheran and Reformed churches, and while declaring in favor of confessional Lutheranism, he held aloof from the old Lutheran party. In 1852 he returned to Tübingen as director of the seminary and professor of Old Testament theology in the university. Here he produced his principal work, *Theologie des Alten Testaments* (2 vols., 1873-74; English trans., Edinburgh, 1874-75; New York, 1883). Œehler was one of the foremost Old Testament scholars of his time of the conservative school. He contributed many articles to Herzog's *Encyclopædie*, and wrote a *Lehrbuch der Symbolik* (1876, edited by Johann Delitzsch). Consult Josef Knapp, *Ein Lebensbild von Œehler* (Tübingen, 1876).

ŒEHME, ʔ'me, ERWIN (1831-). A German landscape and genre painter, born in Dresden. He was a son and pupil of the landscape painter Ernst F. Œehme (1797-1855), and also pupil of Ludwig Richter and of the Dresden Academy, but formed his style mainly by studying nature on his travels through Germany, Switzerland, France, and England. A fine specimen of his landscapes is the "Stone Quarry in Saxon Switzerland" (1860, Dresden Gallery). In 1877 he executed in the banquet hall of the Albrechtsburg at Meissen three mural paintings representing the "Rape of the Saxon Princes in 1415," and in 1887-89 a picture in heroic size of the "Declaration of Venezuela's Independence by Bolivar," for the House of Parliament at Caracas. He also did excellent decorative work, especially in imitation of old Gobelins for several royal palaces.

ŒIL DE BŒUF, ʔ'y de bœf (Fr., ox-eye). A term applied in architecture to those small round or oval openings in the frieze or roof of large buildings which serve to give light to spaces otherwise dark. The most famous is in the ante-room of the royal chamber at Versailles, which gave name to the apartment.

ŒELAND, ʔ'lant. An island in the Baltic Sea. See **ÖLAND**.

ŒELS, ʔ'ls. A city of Prussia. See **ÖLS**.

ŒELWEIN, ʔ'l'win. A city in Fayette County, Iowa, 53 miles north of Cedar Rapids; on the Rock Island system, and at the junction of four branches of the Chicago Great Western Railroad (Map: Iowa, F 2). The latter maintains large repair shops here, and there is also a foundry. The government, under a charter of 1888, revised in 1897, is vested in a mayor, elected every two years, and a unicameral council. The water-works are owned and operated by the municipality. Settled in 1875, Œelwein was incorporated first in 1888. Its growth during the decade 1890-1900 was extraordinarily rapid, a popula-

tion in 1890 of 830 having increased to 5142 in 1900.

ÆNANTHYLIC ACID from *ænanthyl*, from Lat. *ænanthe*, from Gk. *αἰνάνθη*, *oinanthê*, first shoot of the vine, vine, from *οἶνος*, *oinos*, wine + *άνθος*, *anthos*, flower), NORMAL, $\text{CH}_3(\text{CH}_2)_7\text{COOH}$. One of the volatile fatty acids. It was formerly believed to be the acid component of an ester to which the characteristic odor of wine is due; it has, however, been shown that that odor is really due to a mixture of esters of the acids called capric and caprylic. Ænanthyllic acid may be prepared best by the oxidation of ænanthol, $\text{C}_8\text{H}_{17}\text{CHO}$, a product of the distillation of castor-oil.

ÆNEUS, *Ēnūs* (Lat., from Gk. *Οἰνέας*, *Oineus*). King of Calydon, the father, by Althæa, of Meleager and Deianira, and, by Melanippe, of Tydeus. The famous Calydonian boar, afterwards slain by Meleager, was sent to devastate his territory as a punishment for his omission of Artemis in sacrificing to all the gods upon reaping the produce of his fields. Æneus was dethroned by the sons of his brother Agrius, and rescued by Diomedes, who took him to Argolis, where he was afterwards slain by the two surviving sons of Agrius. The city of Ænoe was built upon the site of his burial place. He was the first to receive the vine from Bacchus, who taught him its cultivation, and the juice of the grape was from his name called *οἶνος*, wine.

ÆNOMAUS (Lat., from Gk. *Οἰνόμαος*, *Oino-maōs*). The son of Ares and King of Pisa in Elis. Having been warned that he would perish if his daughter married, he made it a condition that all suitors of Hippodamia should strive with him in a chariot race from Pisa to the altar of Poseidon on the Isthmus of Corinth, and if conquered should be slain. Pelops, son of Tantalus, on entering the contest, bribed Myrtilus, the charioteer of Ænomaus, to disable the latter's chariot, and with a chariot and horses given him by Poseidon was victorious in the race. Ænomaus was killed, and when dying cursed Myrtilus, to whom Pelops refused the promised reward and cast him down from Cape Geræstus. The curse uttered by the dying Myrtilus on Pelops brought in its train the misfortunes which pursued the latter's family.

ÆNONE, *æ-nō-né* (Lat., from Gk. *Οἰνώνη*, *Oinōnē*). A nymph, who became the wife of Paris while he was still a shepherd on Mount Ida. She warned him of the results of his journey to Greece, and told him that she only could cure him if he should be wounded. When Paris was wounded by the arrow of Philoctetes, he sought the aid of Ænone, who, angered by his desertion, declined to assist him, but repented and in grief at coming too late cast herself on his funeral pile. The story is told in Tennyson's poem *Ænone* (1832).

ÆNOPIDES, *æ-nōp'i-déz* (Lat., from Gk. *Οἰνωπίδης*, *Oinopidēs*). A Greek astronomer, born in Chios, possibly a contemporary of Anaxagoras. He learned astronomy in Egypt and there, no doubt, got his knowledge of the obliquity of the ecliptic, the discovery of which is often ascribed to him. Ælian attributes to Ænopides the fifty-nine-year cycle intended to harmonize the lunar and solar years, and the determination of the length of the solar year as 365 $\frac{1}{4}$ days. He

had a strange theory of the rise and fall of the Nile that subterranean waters are warmer in winter and colder in summer than surface waters, so the winter heat carries the moisture into the earth. Several geometrical propositions are said to have been discovered by him, and he held the theory that the Milky Way was the original path of the sun, which it had left in fright.

ÆNOTHERA (Neo-Lat., from Gk. *οἰνοθήρα*, *oinothēras*, plant whose root smells like wine, from *οἶνος*, *oinos*, wine, + *θήραν*, *thēran*, to seek). A genus of plants of the natural order Ænotheraceæ having four petals and eight stamens, the calyx-lobes 4-cleft, the segments reflexed; the capsule 4-valved, with many naked seeds. The evening primrose (*Ænothera biennis*), a beautiful plant native of the United States, has been known in Europe since 1614, and is now naturalized in many parts of Europe, on the banks of rivers, in thickets, on sandy grounds, etc. The plant is often cultivated for its fragrant flowers, which expand in the evening and at the summit of a leafy spike in the second year. The root somewhat resembles a carrot in shape, but is short; it is usually red, fleshy and tender; it is sometimes eaten in salads or in soups, and as a boiled vegetable. Several other species of Ænothera, natives of North America, are cultivated in gardens.

OERSTED, *ĕr'stēd*, ANDERS SANDŒE (1778-1860). An eminent Danish jurist, brother of Hans Christian Oersted (q.v.), born in Rudkjøbing. He was educated at the University of Copenhagen, embraced the profession of law, and rose to eminence as a practitioner and as editor of legal periodicals; he also wrote several treatises on the philosophy of Kant and Hegel. He became a judge of the highest court of Denmark in 1810. In 1825 he was intrusted with the drawing up of the ordinances of the Danish law, and in 1831 had an important share in forming the provincial constitutions granted by Frederick VI. to the Estates. For several years he was high commissioner, or King's representative at the Assembly of the Estates, and from 1842 to 1848 was a member of the Danish Cabinet. In 1853 he became Premier, and acted successively as Minister of Public Worship, of the Interior, and of Public Instruction and Justice. He now showed himself a decided Conservative. At the close of 1854 the King dismissed the Oersted Cabinet. In 1855 Oersted and his colleagues in the Cabinet were impeached by the Diet; the trial lasted for a year and resulted in acquittal. An autobiography of Oersted, *Af mit Liv og min Tids Historie* (1851-57), contains valuable material for Danish historians. Among his other works is a manual of Danish and Norwegian law, *Haandbog over den danske og norske Lovkyndighed* (6 vols., 1822-23).

OERSTED, HANS CHRISTIAN (1777-1851). A distinguished Danish physicist, brother of the preceding. He was born at Rudkjøbing, on the Danish island of Langeland, and studied at the University of Copenhagen, where he took the degree of doctor of philosophy in 1799. Soon after becoming assistant to a professor of medicine, he gave lectures on chemistry and natural philosophy. In 1806, after having enjoyed a traveling scholarship for several years, in the course of which he visited Holland, Germany, and Paris, he was appointed professor of natural philosophy in the

University of Copenhagen. In 1812 he again visited Germany and France, after having published a manual under the title of *Videnskaben om Naturens Almindelige Love, and Forste Indledning til den Almindelige Naturlære* (1811). During his residence in Berlin he wrote his famous essay on the identity of chemical and electrical forces, in which he first developed the ideas on which were based his great discovery of the intimate connection existing between magnetism and electricity and galvanism—a treatise which, during his residence in Paris, he translated into French, in conjunction with Marcel de Serres. Oersted's great discovery, made in 1819, was that a magnetic needle was deflected by a current in a wire passing over or below it. This is the earliest experiment in electric magnetism, and at once paved the way for the work of Ampère and made possible the galvanometer, the electromagnet, and other apparatus soon to be devised. This discovery was announced shortly afterwards in a Latin essay, entitled *Experimenta circa Effectum Conflictus Electrici in Acum Magneticam*. This memorable experiment obtained for Oersted the Copley medal from the Royal Society of England, and the principal mathematical prize of the Institute of Paris. Oersted endeavored to make science popular among all classes; with this object he wrote numerous works, contributed scientific papers to the newspapers and magazines of his own country and Germany, and, in addition to his regular lectures in the university, gave courses of popular scientific lectures. Among the works specially written to promote the diffusion of scientific knowledge, those best known are *Aanden i Naturen* (Copenhagen, 1850) and *Naturlærens mechaniske Deel* (Copenhagen, 1844). The majority of his more important physical and chemical papers are contained in Poggendorff's *Annalen*.

OERTEL, Ȣrtel, MAX JOSEPH (1835-97). A German physician, specialist in diseases of the lungs and heart. He was born at Dillingen, studied at Munich, and in 1867 became docent of laryngology there, from which post he was promoted to a professorship in 1876. Oertel discovered the bacillus of diphtheritis in 1868, but is better known for his system of hill-climbing as a cure for faulty respiration or circulation. A device for examining the larynx, the laryngostroboscope, is one of his inventions. He contributed to Ziemssen's *Handbuch der speziellen Pathologie und Therapie*, Liebreich's *Encyclopädie der Therapie*, and other encyclopædic works. His most famous work is *Allgemeine Therapie der Kreislaufstörungen* (1884). Besides he wrote: *Ueber den laryngologischen Unterricht* (1878); *Ueber Terrainkurorte zur Behandlung der Kreislaufstörungen* (1887); *Pathogenese der epidemischen Diphtherie* (1887); *Massage des Herzens* (1889); and *Das Laryngostroboskop und seine Verwendung in der Physik, Physiologie und Medizin* (1895).

OESSEL, Ȣzel. A Russian island. See ŒSEL.

OESER, ȢzȢr, ADAM FRIEDRICH (1717-99). A German painter, etcher, and sculptor, born at Pressburg, Hungary. He was a pupil, in Vienna, of Van Schuppen and Daniel Graub at the Academy, where he was awarded the first prize in 1735, and of Raphael Donner in sculpture. In 1739 he went to Dresden, won reputation with portraits, executed mural paintings in Castle

Hubertsburg in 1749, and removed to Leipzig in 1750. Appointed director of the newly founded Academy there in 1764, he zealously opposed mannerism in art and was a stout champion of Winckelmann's advocacy of reform on antique lines. Among the numerous pupils he educated was Goethe, with whom he kept up friendly relations afterwards at Weimar. As specimens of Oeser's paintings may be mentioned "The Artist's Children" (1766, Dresden Gallery); "Marriage at Cana" (1777), and four others (Leipzig Museum); and "The Painter's Studio" (Weimar Museum). His best effort in sculpture is the monument of Elector Frederick Augustus (1780) on the Königsplatz in Leipzig. For his biography consult Dürr (Leipzig, 1879).

ŒSOPH'AGUS (Neo-Lat., from Gk. *œsophagos*, *œsophagos*, gullet, from *œsôv*, *oîsîn*, to be about to carry + *phagêin*, *phagein*, to eat), or GULLET. A membranous canal, about 9 inches in length, extending from the pharynx to the stomach, and thus forming a part of the alimentary canal. It commences at the lower border of the cricoid cartilage of the larynx, descends in a nearly vertical direction along the front of the spine, passes through an opening in the diaphragm, and thus enters the abdomen, and terminates in the cardiac orifice of the stomach opposite the ninth dorsal vertebra. It has three coats—viz. an external or muscular coat (consisting of two strata of fibres of considerable thickness—an external, longitudinal, and an internal, circular); an internal or mucous coat, which is covered with a thick layer of squamous epithelium; and an intermediate cellular coat, uniting the muscular and mucous coats. In this tissue are a large number of œsophageal glands, which open upon the surface by a long excretory duct, and are most numerous round the cardiac orifice, where they form a complete ring.

The œsophagus is liable to a considerable number of morbid changes, none of which are, however, of very common occurrence.

The most prominent symptom of *œsophagitis*, or inflammation of the œsophagus, is pain between the shoulders, or behind the trachea or sternum, augmented in deglutition, which is usually more or less difficult, and sometimes impossible. The affection is regarded as a very rare one, unless when it originates from the direct application of irritating or very hot substances, or from mechanical violence.

Spasm of the œsophagus—a morbid muscular contraction of the tube, producing more or less difficulty of swallowing—is a much more common affection than inflammation. The spasm generally comes on suddenly during a meal. Upon an attempt to swallow, the food is arrested, and is either immediately rejected with considerable force, or is retained for a time, and then brought up by regurgitation; the former happening when the contraction takes place in the upper part of the canal, and the latter when it is near the lower part. In some cases solids can be swallowed, while liquids excite spasm; while in other cases the opposite is observed; but in general either solids or liquids suffice to excite the contraction, when a predisposition to it exists. The predisposition usually consists in an excitable state of the nervous system, such as exists in hysteria, hypochondriasis, and especially in hydrophobia. An attack may consist of a single

paroxysm, lasting only a few hours, or it may be more or less persistent for months or even years. The treatment must be directed to the establishment of the general health. A temporary cure often follows the passage of a bougie.

Paralysis of the œsophagus is present in certain forms of organic disease of the brain or spinal cord which are seldom amenable to treatment. In this affection there is inability to swallow, but no pain or other symptom of spasm; and a bougie may be passed without obstruction. The patient must be fed by the stomach-pump.

Permanent or organic stricture of the œsophagus may arise from inflammatory thickening and induration of its coats. The most common seat of this affection is at its upper part. The symptoms are persistent and gradually increasing difficulty of swallowing, occasionally aggravated by spasm; and a bougie, when passed, always meets with resistance at the same spot. When the contraction is due to inflammatory thickening, it may arise from the abuse of alcoholic drinks or from swallowing boiling or corrosive fluids. If unrelieved, the disease must prove fatal, either by ulceration of the tube around the seat of the stricture, or by sheer starvation. When the affection is due to chronic inflammatory thickening, some advantage may be derived from dilatation by means of the œsophageal bougie. If it is dependent upon malignant disease, and the tissues have become softened by the infiltration of the morbid deposit, the bougie must be directed with the greatest care through the stricture, as a false passage may be easily made into important adjacent cavities.

Foreign bodies not very infrequently pass into the œsophagus, and become impacted there, giving rise to a sense of choking and fits of suffocative cough, especially when they are seated in its upper part. If the body is small and sharp (a fish-bone, for example), it may often be got rid of by making the patient swallow a large, mouthful of bread; if it is large and soft (such as too large a mouthful of meat), it may generally be pushed down into the stomach with the probang; while large hard bodies (such as pieces of bone) should be brought up either by the action of an emetic or by long curved forceps. If the offending body can neither be brought up nor pushed down, it must be extracted by the operation of *œsophagotomy*—an operation which can only be performed when the impacted body is not very low down, and which it is unnecessary to describe in these pages.

Rupture of the œsophagus has occurred from violent vomiting during a state of intoxication and following a heavy meal. It is a fatal, but exceedingly rare accident.

ŒSOPHAGUS, COMPARATIVE ANATOMY OF THE. In length, structure, and appearance in cross-section, there is the greatest variety in different groups of animals, and, indeed, an œsophagus may be entirely wanting, as, for example, in Hydra, where the mouth opens directly into the digestive cavity. The cœlenterates are divided into two great classes according to the origin of the œsophagus; in one, the Hydrozoa, the œsophagus, when present, has arisen from the endoderm, while in the other, the Scyphozoa, it has been formed by an invagination of the ectoderm. In all animals above cœlenterates, where

a mouth is present, there is more or less of an œsophagus, but its appearance varies widely, with the form of the body. Long-necked animals have long œsophaguses as a rule, while in animals with little or no neck the œsophagus may be very short. In mammals its upper part is closely associated with the pharynx, and its muscles are striated (voluntary), but lower down the muscles are unstriated (involuntary). In birds the œsophagus is very extensible and capable of holding a considerable amount of food in storage, and this ability is greatly increased by the development of a special pouch or pair of pouches on the ventral side of its lower part, known as the 'crop.' This crop may be simply a sac for receiving the food or it may be an accessory digestive organ, the juices which it secretes serving to soften and macerate food stored in it. In pigeons during the breeding season this secretion becomes very abundant and milky in character, and is regurgitated into the mouths of the young along with macerated grain. Such food is popularly called 'pigeon's milk.' Regurgitation is very easy for all birds and is habitual with many as a means of defense, or (by lightening their weight) of escape. In both birds and mammals the œsophagus is a musculo-membranous tube, made up of an outer layer of longitudinal (contractor) muscle-fibres, then a layer of circular (constrictor) muscle-fibres, then loose connective tissue containing a thin layer of longitudinal fibres, and finally the glandular mucous membrane, which forms a lining, and is generally folded and plaited, often papillose, unless fully distended.

OESTERLEY, ȢstȢr-lȢ, KARL WILHELM (1805-91). A German historical painter, born at Göttingen, where he studied art-history at the university, before taking up painting in Dresden under MatthȢi. After a sojourn in Rome (1825-29), he established himself as a lecturer at Göttingen, and in 1831 was appointed professor of art-history. He supplemented his studies in painting under Schadow at Düsseldorf (1835-38), then in Munich, where he gave his attention to the frescoes of Cornelius, and 1842 in Paris. In 1845, he became Court painter at Hanover. His best works include: "Jephtha's Daughter" (1835); "Leonore with Her Mother" (1847), after Bürger's ballad; "Memling Nursed by the Nuns at Bruges" (1866), all in the Hanover Museum. He also painted altarpieces and several portraits, and in fresco an "Ascension" (1838), in the Royal Chapel, Hanover. With Otfried MȢller he edited at Göttingen *DenkmȢler der alten Kunst* (1834-39). His son **KARL** (1839—), born at Göttingen, became a successful landscape painter. First instructed by his father, he studied afterwards under Bendemann and Deger at the Düsseldorf Academy, but turned from religious subjects, which he essayed originally, to landscape. His frequent study trips to Norway after 1870 resulted in the depiction of such scenes from those regions as "Raft Sound" (1879, Breslau Museum); "View on Salten Fjord" (1887, Hamburg Gallery); "Oldenvand on North Fjord" (1885, National Gallery, Berlin); and "Romsdal Fjord" (1891, Leipzig, Museum); all distinguished by lofty conception, brilliant coloring, and exquisite light effects.

OETINGER, ȢtingȢr, FRIEDRICH CHRISTOPH (1702-82). A German theologian. He was born

at Göppingen, in Württemberg, and studied at the University of Tübingen, where he devoted himself to the philosophy of Leibnitz and Wolf. He also became intimate with Bengel, Francke, Spangenberg, and Zinzendorf. After traveling extensively he was appointed reader of theology in the University of Halle. In 1738 he was appointed pastor at Hirschau and became the leader of the Pietists in that part of Germany. About this time he became an earnest student of the writings of the mystic Böhme, and also an ardent disciple of Emanuel Swedenborg, some of whose writings he translated into German. In 1766 he published a treatise entitled *Earthly and Heavenly Philosophy*, which, with his translation of the works of Swedenborg, brought upon him the reprehension of his ecclesiastical superiors. Yet he was protected by the Duke of Württemberg, and was nominated to the superintendence of the churches in the district of Weinsberg, afterwards in that of Herrenberg, and subsequently appointed prelate at Murrhardt. His works, about seventy in number, were edited by Ehmann (11 vols., Stuttgart, 1858-63), and his autobiography by Hamberger (ib., 1845). Consult his *Life* by Ehmann (Stuttgart, 1869), and Auberlen, *Die Theosophie F. O. Oetingers nach ihren Grundzügen* (Tübingen, 1847).

OETTINGEN, *Ō'ting-en*, ALEXANDER VON (1827—). A German theologian. He was born at Vissut, near Dorpat, and studied at Erlangen, Bonn, and Berlin. From 1854 to 1891 he was professor of theology at Dorpat. He published, among many other theological treatises, *Die Moralistik und die christliche Sittenlehre* (1868-74), which is his chief work; *Wahre und falsche Autorität* (1878); and *Theorie und Praxis des Heirats* (1892).

O'FARRELL, MICHAEL JOSEPH (1832-94). A bishop of the Roman Catholic Church. He was born at Limerick, Ireland, educated at the Missionary College of All Hallows, and proceeded to the Seminary of Saint Sulpice, Paris, for his theological course. In 1855 he was ordained priest in Ireland. Intending to enter the Canadian mission, he returned to Saint Sulpice, but was retained at the institution for a year as professor of dogmatic theology, after which he went to Montreal, serving first as a member of the faculty of the Grand Seminary, afterwards as priest at Saint Patrick's and Saint Bridget's. In 1869 he went to New York as assistant at Saint Peter's, Barclay Street. He became pastor of the church in Rondout, N. Y., in 1872, but the following year returned to Saint Peter's as priest in charge. During his eight years' pastorate he established a school whose attendance numbered 700. On November 1, 1881, he was consecrated bishop of the newly created diocese of Trenton, N. J.

OFFA (†796). A King of the Mercians in Anglo-Saxon England who succeeded the usurper Beornræd in 757. The kingdom was much weakened, and he probably spent the early years of his reign in restoring order at home. In 771 he began to conquer outlying territory; he defeated the Kentish forces in 775; and fought against the West Saxons (779) and the Welsh. (See OFFA'S DYKE.) Offa had cordial relations with the Roman See; won from the Pope the grant of a Mercian archbishopric; and sent yearly to Rome for charities 365 mancuses (ap-

parently the origin of 'Peter's Pence'), besides doing much for the benefit of the Church at home. He carried on a correspondence with Charlemagne, and promoted trade between England and the Continent.

OFFA'S DYKE. An ancient earthwork extending along the whole border between England and Wales and attributed to Offa, King of Mercia. Portions of this rampart still stand to a considerable height, though much of it has been almost obliterated by time and the elements. This structure, which represents a vast amount of labor, seems to have been intended as a line of demarcation between the Anglo-Saxon and Celtic populations of England and Wales respectively. On the eastern or English side of Offa's Dyke at varying distances from it is an inferior earth rampart called Watt's Dyke, and it is conjectured that the space between them may have been a neutral zone for trading purposes.

OFFENBACH, *ŏf'en-bāc*. The capital of a circle in the Grand Duchy of Hesse, Germany, on the Main, four miles east of Frankfort (Map: Germany, C 3). Its palace is the winter residence of the Isenburg-Birstein family, to whom the old castle, now in ruins, also belongs. Several churches and a Jewish synagogue are the only other edifices worthy of note. Offenbach is the principal manufacturing town in the grand duchy, its chief manufactures being leather goods, engines, tobacco, textiles and knit wares, chemicals, soap, jewelry, and carpets. Population, in 1890, 35,085; in 1900, 50,508. Offenbach was founded in the tenth century. In 1685 the Isenburg-Birstein family made it their residence. Its importance dates from the end of the seventeenth century, when many French Protestants took refuge within its walls. In 1815 it was united with the Grand Duchy of Hesse.

OFFENBACH, JACQUES (1819-80). A French operetta composer, born at Cologne, of Jewish parentage. He went to France in 1833, and studied the 'cello at the Paris Conservatory under Vasilin. Afterwards he played that instrument in the orchestra of the Opéra Comique and then became music director at the Théâtre Français. While at the latter theatre he wrote the *Chanson de Fortunio* for the *Chandelier* of Musset. He became director of the Bouffes-Parisiens in 1855 and produced his operas there until 1866, after which date they were brought out at different houses. In 1876 he made an unprofitable tour in America, which he described in *Notes d'un musicien en voyage* (1877). The libretto is an indispensable part of Offenbach's operettas. In the witty words and doubtful, if amusing, situations of Meilhac and Halévy lay the opportunities for his own best humor and most ironical caricature. For the rest his merry music, natural verve and extravagance, and the affluence of his ideas, made his operettas the highest form of the genre he created, and of which he remains the undisputed master. He died in Paris. His works include: *Les deux aveugles* (1855); *Le violoneux* (1855); *Le financier et le savetier* (1856); *Croquefer ou le dernier des paladins* (1857); *Le mariage aux lanternes* (1857); *La chatte métamorphosée en femme* (1858); *Orphée aux enfers* (1858); *Daphnis et Chloé* (1860); *Barkouf* (1860); *Monsieur et Madame Denis* (1862); *La belle Hélène* (1864); *Barbe-Bleue* (1866); *La*

grande duchesse de Gérolstein (1867); *La vie parisienne* (1866); *Robinson Crusoe* (1867); *Vert-Vert* (1869); *Les brigands* (1869); *La jolie parfumeuse* (1873); *Madame Favart* (1879); *La fille du tambour-major* (1879); *Belle Lurette* (1880); *Les contes d'Hoffmann* (1881); and many others. Consult Martinet, *Offenbach, sa vie et son œuvre* (Paris, 1892).

OFFENBURG, *Öffen-burg*. A town of Baden, Southern Germany, capital of the circle of the same name (Map: Germany, B 4). It is situated on a tributary of the Rhine, ten miles southeast of Strassburg. It contains ruins of old fortifications, numerous monuments, a town hall in the baroque style, and a gymnasium occupying an old Capuchin monastery. There are cotton and linen weaving and dyeing establishments, tanneries, breweries, and machine shops for the manufacture of agricultural machinery. The town has considerable trade in wine, timber, and cattle. Population, in 1890, 8576; in 1900, 13,664.

OFFERING (AS. *offrung*, *ofrung*, from *ofrian*, from Lat. *offerre*, to offer, from *ob*, toward, before + *ferre*, to bear; connected with Gk. *φέρω*, *pherein*, Skt. *bhar*, Goth. *bairan*, OHG., AS. *beran*, Eng. *bear*). A term primarily applied to the different forms of sacrifices in the Hebrew ritual. Offerings are of various kinds, as the burnt offering (*'ōlāh*), peace offering (*shelem*), thank offering (*tōdāh*), free-will offering (*nidābāh*), meal offering (*minchāh*), sin offering (*chattāth*), guilt offering (*'ashām*), drink offering (*nesek*). The common Hebrew word for an offering in the sense of a ritualistic sacrifice is *korban*, which designates the sacrifice as something 'brought near' to the deity, or to the altar, and as such *korban* is occasionally used to designate a sacred gift in general. (See CORBAN.) Another term for offering in a more secular sense is *minchāh*, which is primarily a 'tribute' offered either by way of a compliment or for the purpose of retaining the good-will of an individual or a deity. In the Old Testament ritual *minchāh* has acquired the technical sense of a meal (or bloodless) sacrifice, in contrast to *zebach* (slaughter), which is invariably a 'bloody' sacrifice. Another specific form of religious offerings, though distinct from sacrifices, is the heave offering (*tērūmah*), denoting (a) that which is 'lifted off' or separated and used of the gifts taken from the soil (first-fruits, tithes, firstlings); (b) contributions of money and spoils of war offered for sacred purposes; (c) portions of the sacrifices and other dues belonging to the priests. See SACRIFICE; FIRST FRUITS; OFFERTORY.

OFFERTORY (OF., Fr. *offertoire*, from Lat. *offertorium*, place where offerings are brought, from *offertor*, one who offers, from *offerre*, to offer). In the liturgical sense, an antiphon in the mass which introduces the more sacred part or *missa fidelium*, as the analogous introit (q.v.) does the *missa catechumenorum*. It is taken from the Psalms (since the thirteenth century limited to a single verse, except in requiem masses), and varies with the season or festival. It is immediately followed by the oblation of the bread and wine: hence the name, which is incorrectly applied by many people to the collection sometimes taken up at this stage of the service. The name is also used for the musical composition which is rendered at that time, and which

may be an anthem, motet, or even a purely instrumental selection.

OFFICE (OF., Fr. *officier*, from ML. *officiarius*, officer, from Lat. *officium*, office, from *opificium*, performance of work, from *opifex*, workman, from *opus*, work + *facere*, to do). In general, a delegated service or authority of a public or semi-public character. In practice the term is usually limited to positions of trust or authority under the Government or in a corporation or voluntary association. At the common law public office was not regarded as a public trust, but as a private emolument, and Blackstone in his book on property enumerates offices among incorporeal hereditaments. Thus conceived, a public office may, like other real property, be held in fee simple, in fee tail, for life, or for years, and it may even be made the subject of sale and be alienable by deed or will. Offices of this character have generally become obsolete or have been abolished, but in England certain honorary offices are still held by a species of tenure and descend to the heirs of the holder thereof. See CIVIL SERVICE.

An appointment to office carries with it, as an incident thereof, the right to its emoluments. Civil or public offices are usually classified as ministerial and judicial. An office is ministerial when its exercise depends on the command or direction of others; judicial, when the officer is called upon to employ his own discretion. An example of the first is a sheriff, of the second a judge of a court of law. The two are sometimes united in one. The office is held for the benefit of the public, and may be abolished by legislation, unless such action be expressly forbidden by the Constitution. When the office is in its nature judicial, the duties cannot be performed by deputy, as the personal skill and judgment of the officer are the reasons for his holding the office. With ministerial offices the reverse is the case. Thus a sheriff or other court officer may appoint deputies, and their acts are good in law; and the appointing officer remains responsible for such acts.

Statutes in most of the States provide that offices shall not be sold, and such a sale would be void anywhere as contrary to the policy of the common law. So any agreement between the officer and one who by influence procures his appointment, to divide the compensation received, would be altogether void. It was a principle of the common law that no term of office should be created so as to end at a certain time in the future, nor for a fixed term of years, but should be held for life or during good behavior. This was to prevent the holding of office after competency to perform the duties had ceased, and to render it impossible that the office should survive the officer. It is common in this country to limit the term to the life of the incumbent and to the attaining of a certain age, as seventy years. Two offices cannot be held by the same person where one is in the nature of its duties inconsistent with the other. This inconsistency may be patent from the nature of the offices or it may be declared to exist by act of legislation. Where an office is filled in common by several persons, it has been held that if the office is of a public character all the officers must meet for consultation, but that a majority may act, while if the office is private, all must concur; but this

is often governed by statute, and a decision by a majority, or even a majority of those present at any meeting, is made binding. Members of State or national legislatures are not usually termed officers, the word being confined in usage to those having executive or judicial authority. A *de facto* officer is one who is in possession of the authority and emoluments of an office without a good title thereto, while a *de jure* officer is one who has the legal right, but not necessarily actual possession. It is evident that it would make much confusion and cause great injustice if all official acts of a *de facto* officer were to be considered as of no effect. Thus, in the case of a judge who was wrongfully on the bench, it would be a great hardship if all judgments given by him, and all criminal convictions of his court, should be set aside. But if suit be brought by a *de facto* officer in his public capacity, he may be debarred from recovery on the ground of defect in title, and the *de jure* officer may test the question of title by bringing a writ of *quo warranto*. See *DE FACTO*.

Public officers are appointed in the United States, under the provisions of the Constitution, by the President with the advice and consent of the Senate, with the exception that to Congress is given the power to vest in the President alone, or in the heads of departments or courts of law, the appointment of 'inferior officers.' Ambassadors, public ministers and consuls, and Supreme Court judges are specified as not belonging to this 'inferior' class, but beyond that the distinction is not clearly defined. In the various States the appointment of public officers is regulated by statutes, and even in the case of Supreme Court judges election is common. The appointee in most cases is required to take an oath to perform faithfully the duties of the office. A bond is often required where the officer has charge of financial interests or his duties affect property rights. Where he performs official acts before giving bond or taking oath, such acts will be valid unless he has been specially prohibited by statute or Constitution from holding the office before the bond was filed or the oath administered.

Compensation of officers may be fixed by law or may be obtained from fees. It is provided in the United States statutes that no officer of the Government who holds an office with a salary of \$2500 or more shall receive extra compensation for performing the duties of any other office unless expressly authorized by law. Where an officer has been removed, his salary will continue until proper notice of the appointment of his successor has been given him. Compensation does not begin until an officer is liable to duty.

The law will presume that a public officer is acting within the scope of his duty until the reverse has been shown. Where discretionary power is given, the officer is made the exclusive judge of the facts. The officer is liable for wrongful acts both to the injured party and to the State. In the first case remedy is by action, in the second by indictment or impeachment. The order of a superior is no bar to an action arising from an unlawful act of the inferior, nor is negligence on the part of a subordinate ground for holding the head officer responsible. Contracts made by public officers are governed by the general law of agency and they cannot bind the Government beyond the extent of their legal au-

thority. If an appropriation is exceeded, the officer is liable. A court officer cannot be held if acting under the proper order of a court having jurisdiction, but may be where there is no jurisdiction. If a sheriff seize property which is by law exempt, he is personally responsible.

The method of removing a public officer of the United States is not provided for in the Constitution, and the question arises whether the power belongs to the President alone or whether he must receive the consent of the Senate. The question has several times come before Congress, and the power of the President to act alone sustained by a very close vote. By statutes of 1867 and 1869 it was provided that a civil officer appointed by the advice and consent of the Senate shall hold his place until removed by the same authority, but that during a recess of the Senate the President may suspend such officer and appoint another to fill the duties of the position. The President is to make a nomination within thirty days after the beginning of the next session of the Senate; and in case the Senate directly refuse to confirm, he may nominate another person. These statutes are known as the tenure-of-office acts (q.v.). State officers may in many cases be removed by the Governor; the subject is governed by statutory enactments, which vary greatly in the different States. Elective offices cannot be vacated by an executive officer without showing cause, such as malfeasance or embezzlement. A term of office may be extended or reduced by action of the Legislature unless such action be prohibited by constitutional provision or the office be elective in its nature. Officers of the United States courts hold during good behavior, but those of the Territorial courts do not fall within the clause of the Constitution already referred to, and depend upon the action of Congress for the limitation of their terms. If neither State nor National Constitution prescribe the length of a term, the subject is under legislative control, and may be extended or shortened, or the office abolished altogether. See such titles as DIRECTOR; SECRETARY; GOVERNOR; PRESIDENT, etc.; and consult authorities under such titles as CONTRACT; TORT; AGENT; ADMINISTRATIVE LAW; MUNICIPALITY, etc.

OFFICE, HOLY, CONGREGATION OF THE. See INQUISITION.

OFFICE FOUND. In case of an inquest of office, a finding by the jury that the property which is the subject of the inquest is forfeited to the Crown or State. Such a finding, by which lands were formerly declared forfeited under the feudal laws, is now in the United States generally a necessary part of the proceedings that must be taken to enforce the forfeiture to the State of lands held by aliens who at common law are or become under a legal disability to hold lands vested in them, and also of the proceedings taken to vest in the State title to lands left by a person without any heir. The procedure, however, is rarely resorted to against an alien while living; and sometimes upon the death of an alien who leaves no lawful heirs, and whose natural heirs are disqualified to take his lands, special statutes are passed waiving the forfeiture to the State and restoring the lands to the natural heirs. See ALIEN; INQUEST (of office); FORFEITURE.

OFFICER. In a general sense, a person who holds an office, or who is vested with authority to perform certain functions or do certain acts in the interest of, or in and about the management or direction of, a business or a government. As respects a private business the term is generally applied to certain members of a corporation who are specially intrusted with the management of its affairs, and upon whom service of papers is generally required to be made to be binding upon the company. Under this class are commonly included the president, directors, treasurer, secretary, and other persons similarly intrusted with an active participation in the affairs of the company by the constitution or by-laws. For further information as to the rights, duties, and liabilities of such officers, see such titles as CORPORATION; DIRECTOR; ULTRA VIRES; CONTRACT, etc.; and also consult the authorities referred to under CORPORATION; AGENT, etc.

With relation to governmental officers it has been said that the term 'office' "embraces the idea of tenure, duration, emolument, and duties." But it seems certain that emolument is not necessary to constitute one an officer, since there are numerous positions which are strictly termed 'offices,' but which carry no salary or emolument of any kind. It does appear necessary, however, that a Government position must have more than one of the characteristics mentioned to constitute the person holding it an officer. Thus, if a person simply performs such duties as are required of him by those employing him, and his responsibility is limited to these, and he receives no certificate of appointment, takes no oath, has no term of office, and exercises no powers and discharges no duties conferred upon him directly by law, he is not an officer, and he does not hold an office, although he is employed by public officers and is wholly engaged about public work.

An officer is to be distinguished from a mere employee. The most important basis of distinction is that an employee is such by virtue of a contract, while a person cannot be made an officer by virtue of a contract merely, but his position finds its source and limitations in some act of governmental power. The conception of an officer, however, does not depend in any way upon the character of the duties to be performed, nor is it essential that the officer should be invested with any power of compulsion, or that he should be permanently occupied in the discharge of official duties, or that his duties should or should not be discretionary. The only requirement that appears to be necessary is that the duties shall be discharged in the interest of the Government, and that the right to discharge them shall be based upon some provision of law, and not upon a contract. Governmental officers are commonly classified as *executive*, or those whose duties are mainly to enforce the execution of the laws; *legislative*, or those whose duties relate chiefly to the enactment of laws; *judicial*, or those whose duties relate chiefly to the interpretation and application of the laws; *ministerial*, or those whose duties are chiefly to carry out the lawful instructions of their superiors; *military*, or those having military commissions, and *naval*, or those having command in the navy. See such titles as EXECUTIVE DEPARTMENT; JUDGE, etc.

Another important classification is that of honorary officers and professional officers, *professional officers* being those who devote their entire

time to the discharge of public functions and are restricted by law from exercising any other occupation, and who receive a compensation sufficiently large to enable them to live without resorting to other means. *Honorary officers*, on the other hand, are those who do not devote their entire time to their public duties, but may at the same time carry on some regular business as a means of support, and receive a compensation which is insufficient for support, or merely nominal, or may receive no compensation at all. In the United States the legal distinction which most nearly corresponds to this is that between *lucrative* and *honorary* officers, the conception of professional officers being not yet fully worked out. The professional officer is characteristic of the bureaucratic administrative system, such as that which existed in Prussia from 1720 to 1808, and in France in 1800; the honorary officer is characteristic of the system of administration (called self-government) which existed in England in the eighteenth century. All existing systems of administration are formed by a combination of professional and honorary officers, the honorary-officer system predominating in the United States and the professional-officer system in Europe, especially upon the Continent.

Most officers become such by either appointment or election, the method of election being much more common in the United States and in England than in most other modern countries. The official relation is sometimes formed by drawing of lots, as in the case of the jury, or as a result of seniority, or sometimes by inheritance. In general it can be formed only in one of the ways recognized by law, and the acts of persons who assume to be officers without right are void both as against the public and third parties; but persons who, though not legally officers, are yet acting under cover of right are regarded as lawful officers for many purposes, and are called officers *de facto*. In England and in the United States, since the reign of Queen Anne, the rule has been that the title to an office is to be tried by the writ of *quo warranto* or an information in the nature of a *quo warranto*. One who is clearly entitled to an office may obtain possession of the insignia of office, the public buildings, records, etc., by *mandamus*.

The general obligations imposed upon officers are of two kinds: First, those which the law positively states that the officers must or must not do, and the violation of which is punished by penalties of criminal character. Second, those which arise from the very existence of the official relation, and which are maintained chiefly by the *esprit de corps* of the official body. When the *esprit de corps* is high, the system of positive requirements is usually correspondingly weak.

For the rights and duties of various particular officers, and for further information, see the titles treating of various public officers, as BAILIFF, DEPUTY, NOTARY PUBLIC, etc.; also DE FACTO; ULTRA VIRES; CONSTITUTIONAL LAW, etc. Consult the authorities referred to under ADMINISTRATIVE LAW; GOVERNMENT.

OFFICER, PETTY. See PETTY OFFICER.

OFFICERS, MILITARY AND NAVAL, COMMISSIONED. See RANK AND COMMAND.

OFFICIAL PLANTS. See OFFICIAL PLANTS.

OFFICIAL PLANTS (ML. *officinalis*, relating to a shop, from Lat. *officina*, *opificina*, shop, from *opifex*, workman). Those medicinal plants which have a place in the pharmacopœias of different countries, and which are therefore sold—or some of their products or preparations of them—by apothecaries and druggists. The medicinal plants cultivated to any considerable extent are all official, but many are also official which are not cultivated.

A distinction should be made between official and official drugs. *Official drugs* include all those substances, whether vegetable, mineral, or animal, used as medicines, and recognized by the various pharmacopœias.

Official preparations are tinctures, syrups, fluids, extracts, emulsions, etc., made from official drugs, recognized by the pharmacopœia, and therein directed how to be prepared.

OFFSET, or SET-OFF. The splay or sloping part of a wall, etc., joining parallel surfaces when the upper face recedes from the lower. This frequently occurs on buttresses. The offset is usually protected with dressed stones, having a projection or drip on the lower edge to prevent the rain from running down the wall. In surveying an *offset* is a line perpendicular to a given straight line on which may be located at some measured distance a point. Such points on various offsets may determine the position of an irregular or inaccessible line and make it possible to map accurately a plot of land whose boundaries are unsymmetrical or difficult of access. See SURVEYING.

OFFSET. A lateral shoot, either a stolon or sucker, which strikes root and forms a new plant. Strawberries, multiplier onions, and black raspberries are familiar examples of plants generally propagated by offsets.

O'FLAHERTY, ô-flá'ér-tí, RODERIC (1629-1718). An Irish historiographer, born in Moycullen Castle, Galway. He was educated in his native county, made a special study of Irish history and literature, and published the results in *Ogygia, seu Rerum Hibernicarum Chronologia* (1685), the first scholarly work on the subject to reach England. His *Chorographical Description of West or H-Iar Connaught* was published by the Irish Archaeological Society in 1846, and his letters were edited by J. T. Gilbert (1895). O'Flaherty lost his property through revolutionary changes of government, and died in poverty at Parke, near Galway.

OG, ôg (Heb. 'Og, probably connected with 'Agag). An Amoritical King of Bashan, who is said to have lived at the time of the entrance of the Israelites into Canaan. The chief cities of his territory were Ashtaroth and Edrei, and he and his people were defeated at the latter place by the half-tribe of Manasseh which remained east of the Jordan (Deut. iii. 1-13; Josh. xiii. 12). Og is represented as the last of the Rephaim or giants. The story of his bedstead (Deut. iii. 11) may be based on the huge sarcophagi which Phœnician kings had made in imitation of Egyptian customs. Many other fables arose about Og, some of which found their way into the Jewish midrashic collections. See AMORITES.

OGAM, ôg'am (OIr. *ogam*, *ogum*, Ir. *ogham*, Gael. *oidheam*; perhaps connected with Gk. *ôγμωρ*,

ogmos, row, Skt. *ajman*, course, from *aj*, Gk. *âyus*, *agein*, Lat. *agere*, to drive). The name of a script used in various ancient inscriptions in the British Isles. They are found chiefly in the southern parts of Ireland and Wales, and the earliest of them date from the fifth century. They number nearly three hundred in all. The language in almost every case is a primitive form of Gaelic, but some fourteen of them found in Scotland appear to be Pictish. The interpretation of these last is entirely doubtful, and scholars are not even agreed as to whether the Pictish language is Indo-European.

The invention of the ogams is assigned in Irish tradition to a god Ogma (one of the Tuatha de Danann), and this name corresponds very well to Ogmios, described by Lucian as a Gaulish Hercules. But the legend looks like an etymological afterthought; especially since the motive assigned to Ogma was the desire to invent a secret script which only the learned could use, whereas there appears to have been nothing cryptic about the old Ogam alphabet. There existed, to be sure, a kind of pedantic puzzle-speech, also called Ogam, some examples of which have been preserved in Middle Irish manuscripts. But this is to be carefully distinguished from the ancient Ogam alphabet used in inscriptions. The old alphabet was apparently known down to the Middle Irish period, and inscriptions or messages written in Ogam figure more or less frequently in the popular sagas.

The characters have been nearly all made out by recent investigation. They are usually cut along the edge of the stone and read from the bottom upward. In the alphabet which follows the horizontal line represents the edge upon which the notches and lines are graven:

||||| / / / / / + + + + + *
hl.w.s.n hdt.c. Emgfn. aqne.i p.œ.e.

A few of the monuments are bi-lingual.

The inscriptions contain almost nothing besides proper names, but these are of great value for the light they throw upon primitive Celtic phonology and inflection. Compare the article on IRISH LITERATURE.

Brash, *The Ogam Inscribed Monuments of the Gaedhil in the British Islands* (London, 1879); John Rhys, *Lectures on Welsh Philology* (2d ed., London, 1879); Sir Samuel Ferguson, articles in the *Transactions of the Royal Irish Academy*, vol. xxvii., and *Ogam Inscriptions in Ireland, Wales, and Scotland* (Edinburgh, 1887; being the Rhind Lectures for 1884); R. A. Stewart Macalister, *Studies in Irish Epigraphy*, part i. (London, 1897, part ii., 1902). The Pictish problem is discussed by Rhys, *The Inscriptions and Language of the Northern Picts*, Proceedings of the Society of Antiquarians of Scotland, 1892, pp. 263 ff. On the Ogmie puzzle-writing see Thurneysen in the *Revue celtique*, vii., pp. 369 ff.

OGASAWARA-SHIMA, ô-gâ'sâ-wâ'râ-she'-mâ (Jap., islands (owned by) Ogasawara). The Japanese name of the Bonin Islands (q.v.).

OG'DEN. A city and the county-seat of Weber County, Utah, 37 miles north of Salt Lake City; at the confluence of the Ogden and Weber rivers, and on the Union Pacific. Southern Pacific, Oregon Short Line, Ogden and North-

western, and Rio Grande Western railroads (Map: Utah, B 1). It is the seat of the State Industrial School (reformatory) and of State institutions for the deaf, dumb, and blind, of Sacred Heart Academy (Roman Catholic), and of Weber Stake Academy (Mormon). The principal buildings are the city hall, county courthouse, and several of the public school buildings. Union, Lester, and Liberty parks, respectively 5, 10, and 10 acres in area, are notable attractions. The Ogden Cañon, opening at the city limits, is noted for its wildly picturesque scenery and for its waterfall. A pipe line serves to convey an immense electrical energy supplying light, heat, and power for Ogden and Salt Lake City. The city has valuable natural advantages from its location in a productive agricultural, fruit-growing, and mineral region. An important railroad junction, it controls large commercial interests in an export trade in beet sugar, canned goods, grain, and fruit, and as a distributing centre for the surrounding country. Its industrial enterprises, also important, are represented by woolen mills, canning works, brick and tile works, a broom factory, pickle works, etc. Ogden was founded in 1848, was laid out as a city under the direction of Brigham Young in 1850, and was chartered in 1851. The original charter previously governing the city, dated 1861, was repealed by the Legislature of 1898, which enacted a general law for the government of cities and towns of the State. Under this statute, Ogden is governed by a mayor, elected every two years, a unicameral council, and administrative officials, of whom the clerk, auditor, treasurer, attorney, and police justice are chosen by popular vote, and all others appointed by the executive, subject to the consent of the council. Population, in 1890, 14,889; in 1900, 16,313.

OGDEN, AARON (1756-1839). An American soldier and lawyer, born at Elizabethtown, N. J. He graduated at Princeton in 1773, entered the Revolutionary army in 1777, and served until the close of the war, when he was discharged with the rank of major. In 1801 the Federalist Legislature of New Jersey chose him United States Senator, and in 1812 the same party elected him Governor of the State. He afterwards went into partnership with one Daniel Dod for the purpose of running a steamboat between Elizabethtown and New York, and this brought him into conflict with Livingston and Fulton, to whom the New York Legislature had granted the exclusive right to navigate the waters of that State with steamboats. This led to years of litigation and resulted in Ogden's financial ruin. From 1829 until his death he was president of the Society of the Cincinnati. Consult: Dayton, *Address Before the Whig and Chiosophio Societies of the College of New Jersey* (Princeton, 1839); and *Collections of the New Jersey Historical Society*; vol. vii. (1872).

OGDEN, WILLIAM BUTLER (1805-77). An American railroad official. He was born at Walton, N. Y., and became a member of the New York Legislature in 1834. In 1835 he removed to Chicago, and upon its incorporation as a city in 1837 became the first mayor. He was instrumental in building the Galena and Chicago Railroad, of which he was made president in 1847. He advocated canal improvement, was president of the Chicago, Saint Paul, and Fond du Lac

Railroad in 1855, and when, by the consolidation of smaller railroads, the Chicago and Northwestern was formed, he became its president. He was a strong advocate of the Pacific railroads, and was the first president of the Union Pacific Company. In addition to his railroad interests, he was largely engaged in lumbering in Wisconsin. He was also the promoter of many philanthropic and educational movements in Chicago.

OGDENSBURG. A city and port of entry in Saint Lawrence County, N. Y., 142 miles north by east of Syracuse. It is on the Saint Lawrence River, at its confluence with the Oswegatchie, and opposite Prescott, Ont., with which it is connected by steam ferry, and on the New York Central and Hudson River and the Rutland railroads (Map: New York, E 1). Among the prominent educational and charitable institutions are the Ogdensburg Free Academy, Saint Lawrence Hospital (State), city hospital, Saint John's Hospital, and United Helpers' Home. The city has also a fine United States custom-house and post-office, State armory, city hall, public library, Roman Catholic cathedral, and Riverside, Hamilton, Mansion, Crescent, and Grove parks. Ogdensburg, as the terminal of deep-water navigation on the Great Lakes, has regular steamship communication with the principal lake ports, and carries on an important trade in grain, lumber, and general produce, as well as manufactured products, principally lumber, brass curtain rods, silk, and skirts. Many of its industrial establishments utilize water power derived from the river. First settled in 1740, Ogdensburg was incorporated as a village in 1817 and received a city charter in 1868. The government, under the original charter as subsequently amended, the last revision in 1899, is vested in a mayor elected every two years; a unicameral council; and administrative officials, the majority of whom are either elected by the council or confirmed by that body upon nomination by the executive. The civil service commission is appointed by the mayor; and the board of education, one of whose members acts as president, is chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 11,662; in 1900, 12,633.

OGÉ, ô'zhâ', JACQUES VINCENT (c.1755-91). A Haitian revolutionist. He was born atondon, a free man, but a mulatto; served for several years in one of the German armies; and in 1789 was sent to the Constitutional Assembly as a representative of Haiti. When he returned to the island he petitioned the Assembly to free the slaves there. But he was unsuccessful and took up arms in the autumn of 1790, having organized a company in the United States. He won a few battles, then was defeated, and surrendered after receiving a promise that his life should be spared; but he was tried and sentenced to be broken on the wheel.

OGEE' (probably a corruption of *ogive*, on account of the form of the curve when viewed in perspective from below). A molding consisting of two curves, one concave and the other convex. It is called (in classic architecture) *cymatium* or *cyma reversa*. The ogee is also much used in Gothic architecture.

OGEE/CHEE LIME. An American tree. See **TUPELO**.

OGGIONE, ɔd-jō'nā, MARCO DA (c.1470-c.1540). An Italian painter, born at Oggiono, on Lake Como. A pupil and able imitator of Leonardo da Vinci, under whom he studied as early as 1490, he is best remembered for the excellent copies of his master's "Last Supper," one of which (in oil) is in the Royal Academy, London, another (in fresco) in the Brera Gallery, Milan, and a third, on a smaller scale, in the Hermitage, Saint Petersburg. In view of the almost total destruction of the original, the value of these faithful reproductions can hardly be overestimated. Of five fresco paintings executed for the Church of Santa Maria della Pace, Milan, the "Assumption" and "Marriage at Cana" are now in the Brera Gallery, which also contains a masterly canvas of "The Archangels Suppressing Lucifer." In the Louvre may be seen a "Holy Family," in the Berlin Museum a "Madonna," and in the Pinacoteca at Turin a "Christ Bearing the Cross."

OGIER (ɔ'zhyá') **THE DANE**. One of the most popular of Charlemagne's paladins, the hero of several of the chansons de geste of the Charlemagne cycle, the oldest form of which, "La Chevalerie Ogier de Danemarque," was edited by Barrois, and another version by Raimbert. Ogier, son of Godfrey, Duke of Denmark, was brought up as a hostage at Charlemagne's Court. His son being killed by the King's son, a long strife ensued, during which Ogier was long besieged in Castle-Port, defending it with great valor. He inherited the Kingdom of Denmark, but gave it up to return to the French Court, and became one of Charlemagne's foremost champions. In extreme old age he was shipwrecked near the island of Avalon, and carried off by Morgan le Fay to her magic palace. A ring restored his youth, and a magic crown made him forget the past. Two hundred years later he returned to free France from invaders, probably Normans, after which he was carried away again by Morgan to Avalon. As the Danish national hero, Holger Danske, he still sleeps till danger wakes him. He figures in the literature of several countries. In English legends he is known as the father of Sir Bevis of Hampton, and appears in Morris's *Earthly Paradise*.

OGILBY, ɔ'g'l-bi, JOHN (1600-76). A British author and publisher; born in or near Edinburgh. He accompanied Strafford, Lord Deputy of Ireland, to Dublin in 1633, and built a little theatre in Saint Werburg Street. The outbreak of the Civil War in 1641 ruined him, however, and he returned to London destitute. He then learned Latin and Greek, and translated Vergil, Æsop, and Homer. After the Restoration Ogilby enjoyed the favor of Charles II., and after a brief sojourn in Ireland he settled in London and became a publisher. The great fire of 1666 destroyed his printing house and stock, but he soon recovered, and during the next ten years published many fine works, several of which were illustrated with engravings by Hollar, Lombart, Faithorne, and others. During his latter years he devoted himself to the publication of works on geography and topography, freely illustrated with maps and engravings, among which were *An Embassy from the East India Company of the United Provinces to the Grand Tartar Cham,*

Emperor of China (1669); and the first volume of *Britannia*, a work which was to have comprised three volumes, but which was never completed, owing to its projector's death. Consult: Nicolson, *Historical Libraries* (new ed., London, 1796), and Conington's "English Translators of Vergil," in the *Quarterly Review* (London, 1861).

OGILVIE, ɔ'g'l-vi, CLINTON (1838-1900). An American landscape painter, born in New York. He studied in his native city under James Hart, and afterwards went abroad, where he spent much time, especially in France. In 1864 he was elected an associate of the Royal Academy. His landscapes are usually of Swiss or French scenes.

OGILVIE, JOHN (1797-1867). A Scottish lexicographer, born in Marnoch parish, Banff. The loss of a leg forced him to abandon physical labor at twenty-one, and he became schoolmaster while preparing himself for the university. In 1828 he graduated from Marischal College, Aberdeen. He taught privately in that city for three years, and was then mathematical master in Gordon's Hospital until 1859. He wrote *Imitations of Horace* (1831-32), in the Scottish dialect, for the *Aberdeen Magazine*; collaborated in Stackhouse's *History of the Bible* (1836); and from 1838 to the end of his life was engaged in revising and enlarging *Webster's Dictionary* under a new title, the *Imperial*, of which he published an abridgment in 1863, and a student's edition two years afterwards, which he abridged in 1867.

O'GIVE (Fr. *ogive*, *augive*, from ML. *augiva*, *ogive*, from Sp., Port., It. *auge*, highest point, from Ar. *awj*, highest point, zenith). The arch in Pointed Gothic vaulting which crosses the vault diagonally from one angle to another. By extension the term *ogive* is used to mean a Pointed arch, and French critics use it quite generally as synonymous with Gothic.

OGLESBY, ɔ'g'lz-bl, RICHARD JAMES (1824-99). An American soldier and politician. He was born in Oldham County, Ky., was orphaned at eight, studied law while living on a farm and working as a carpenter at Decatur, Ill., and began to practice at Sullivan, Ill., in 1845. He served as a lieutenant in the Mexican War, participating in the battles of Vera Cruz and Cerro Gordo. In 1847 he resumed his law practice at Decatur, and after a short course of study graduated at the Louisville Law School in 1848. During the gold excitement of 1849 he crossed the continent to the mining districts of California, but returned to Decatur in 1851. He was an unsuccessful candidate for Congress in 1858, but in 1860 represented his district in the State Senate. When the Civil War broke out he resigned his seat to accept the position of colonel of the Eighth Illinois Volunteers, and subsequently commanded a brigade at Forts Henry and Donelson, was promoted to the rank of brigadier-general of volunteers in March, 1862, and to that of major-general in November; served under Grant at Shiloh and under Halleck and Rosecrans at Corinth, where he was severely wounded, and commanded the Sixteenth Army Corps from April, 1863, to May, 1864, when he resigned from the service. He was afterwards Governor of Illinois from 1864 to 1869, for several months in 1873, and from 1884 to 1889; and from 1873 to 1879 was a member of the United States Senate.

OGLETHORPE, ō'g'l-thōrp, JAMES EDWARD (1696-1785). An English general and philanthropist, the founder of Georgia. He was born in London, December 22, 1696, and in 1710 entered the army. In 1722 he entered Parliament as member for Haslemere. The unhappy death of a friend in the debtors' prison drew Oglethorpe's attention to the horrible abuses of that institution. He brought the matter before Parliament, and was appointed chairman of a committee to investigate the subject. This experience led to the formation of a plan of colonization as a means of affording relief to insolvent debtors. In 1732 Oglethorpe and others obtained a charter granting them a tract of land in America, between the Altamaha and Savannah rivers. The plantation was called Georgia, in honor of George II., who was much interested in the project. Liberal subscriptions were made, and a Parliamentary grant of £10,000 was obtained. Oglethorpe was appointed Governor, and in November, 1732, sailed with 120 colonists, who founded the town of Savannah (q.v.). Oglethorpe was for nine years the guiding spirit of the settlement. Aside from his administrative activity, his claim to distinction in colonial history lies in his determined efforts to turn back the Spanish tide of colonization and conquest in the South. In expectation of an attack from the Spaniards at Saint Augustine, Oglethorpe organized the defenses of the little colony, and in 1738 he brought over a volunteer regiment of 600 men recruited in England. Upon the outbreak of the War of Jenkin's Ear in 1739, Oglethorpe successfully repelled an attack on Amelia Island, by the Spaniards, and in May, 1740, marched against Saint Augustine at the head of a force of 2000 militia and Indians, but in spite of the coöperation of a small fleet he was forced to abandon the attempt. In the spring of 1742 a threatened invasion of Georgia by a large Spanish force was repelled by Oglethorpe, who inflicted a severe defeat on the enemy at Frederica and thus assured the colony immunity from attack. In 1743 Oglethorpe was made brigadier-general, and in the same year he returned to England, a step rendered necessary by his financial obligations, most of which were incurred in advancing the necessary supplies for the defense of Georgia. During the Stuart invasion of 1745 Oglethorpe was accused by the Duke of Cumberland of failure to overtake the Jacobite fugitives when sent in pursuit of them. He was court-martialed, but acquitted. In 1752 he and the other trustees of Georgia resigned their charter, and the colony became a royal province. There is an admirable biography by Wright, *Memoirs of James Oglethorpe* (London, 1867). Consult also Lecky, *England in the Eighteenth Century*, vol. i. (New York, 1879). See GEORGIA.

OGMORE (ō'g'mōr) AND **GARW** (gār'w). A coal-mining town in Glamorganshire, Wales, 2½ miles southwest of Bridgend (Map: Wales, C 5). During the last decade much activity has been shown in the promotion of public industrial improvements. Of archaeological interest in the neighborhood are Ogmores Castle, a Norman ruin; the remains of the twelfth-century fortified priory of Ewenny; and Coity Castle and Church. Population, in 1891, 13,800; in 1901, 19,912.

O'GOORMAN, THOMAS (1843—). An American bishop of the Roman Catholic Church, born

in Boston, Mass. He lived in Chicago and in Saint Paul, Minn., until 1853, and for twelve years thereafter studied in France. In 1867 he took a pastoral charge in Rochester, Minn., but left it in 1878 to become a member of the Paulist community in New York City for four years, and was then pastor at Faribault, Minn., until 1885. The following year he went to Saint Thomas College, Saint Paul, as professor of dogmatic theology, and was the first president of that institution. In 1890-95 he was professor of modern Church history in the Catholic University, Washington, D. C. He received his D.D. degree from the Pope in 1893, and in 1896 was consecrated Bishop of Sioux Falls, S. D. His publications include *A History of the Roman Catholic Church in the United States* (1895).

OGOWAI, ō'gō'wā', or **OGOVÉ**, ō'gō'vā'. The principal river of French Congo, equatorial West Africa. It rises about 150 miles northwest of Stanley Pool, and flows first northward through extensive savannas, and then westward through a dense forest region, where it leaves the inland plateau in a series of falls and rapids. Finally turning southward, it enters the Atlantic Ocean through a large delta in latitude 1° S. The Ogowai flows through a densely populated country, but, owing to its numerous rapids, its commercial importance is not as great as it was thought to be before its upper course was explored. Its length is over 700 miles, and it is navigable for small steamers a distance of 200 miles from its mouth. Along its banks are a number of European trading stations.

O'GRA'DY, STANDISH (1846—). An Irish author, and promoter of the Celtic renaissance. He studied at Trinity College, Dublin, where he graduated with high honors. Then he read and practiced law, but gave it up for journalism, and that in turn for Irish history and legend, a field in which his studies and publications are very important. They include *The Bog of Stars*, legends of Elizabethan Ireland (1893), and other collections of tales; and historical essays: *History of Ireland* (1881); *The Story of Ireland* (1894); and, with Sir G. Carew, *Patata Hibernia, or the Wars in Ireland* (1896).

O'GROWNEY, EUGENE (1863-99). An eminent Irish Gaelic scholar, born at Ballyfallon, Athboy, Ireland. He entered the Diocesan Seminary of Saint Finans at Navan, and while there developed an interest in the Gaelic language and literature. Later, while a student in Maynooth College (1882-88), he devoted his leisure to the study of Irish history and antiquities. In 1889 he was ordained to the priesthood, and appointed a curate in the parish of Ballinacarrigy, County Westmeath. In 1890 he was appointed associate editor of the *Gaelic Journal*. Previously to this, during his vacations from Maynooth, he had paid several visits to the Aran Islands to learn the folk-tongue Irish, and in common with Professors Zimmer and Kuno Meyer, did much to establish the reputation of Inis Meadhoin as an Irish summer school. He afterwards held the reëstablished chair of Irish at Maynooth and later was elected a member of the Royal Irish Academy. He wrote many text-books, as well as numerous contributions to the current publications. In 1894 his health gave way, and he came to America, and settled in Arizona. He died at Los Angeles, Cal.

OGY'GES, or **OGYGUS** (Lat., from Gk. Ὀγυγῆς, *Ōgygēs*, Ὀγγυγος, *Ōγγygos*). In Theban legend, one of the early kings of Boeotia, the son or grandson of Poseidon. In his reign a great flood took place in Boeotia, which destroyed cities on Lake Copais. His name was borne by one of the seven gates of Thebes, near which his grave was said to be. Later systematizing chronicles introduced Ogyges to Athenian legend, as King of Eleusis or even first King of Athens, while others transferred him to Egyptian Thebes. Whatever the origin of the name, there is much to show that Ogyges was originally the name in Boeotia of a sea-god like Poseidon.

OGY'GIA (Lat., from Gk. Ὀγγυγία *Ōγγygiā*). In Homer, the mythical island of Calypso, where she detained Odysseus. The word is originally an adjective, and describes the island as belonging to the sea-god Ogyges, whether identified with Oceanus or Poseidon. Later commentators tried to localize the island near Crete or Italy; in Homer its location is wholly indeterminate in the far West.

O'HA'GAN, THOMAS, first Baron (1812-85). An Irish jurist and statesman, born at Belfast. He was called to the Dublin bar in 1836, for the following four years he edited the *Newry Examiner*, and was afterwards associated with his friend Daniel O'Connell in lawsuits bearing upon national rights. He fell out of favor with the Patriot Party by his defense of the union with England, by his appointment to the Board of National Education in 1858, and to the Attorney-Generalship in 1862, but, despite opposition, he was sent to Parliament from Tralee in 1863. Five years afterwards, under Gladstone, O'Hagan was made Lord Chancellor of Ireland and served until 1874. He was the first Roman Catholic raised to that office during two centuries, and he took his seat in the House of Lords in 1870. In 1880 he was made vice-chancellor of the Royal University of Ireland, founded in that year, and the same year Gladstone, on his return to power, called him to resume the Lord Chancellorship of Ireland, but O'Hagan's health forbade his keeping it for more than a year, though he had time to make an eloquent appeal for the Irish Land Bill. His *Occasional Papers and Addresses* were published in 1884, and his *Speeches and Arguments* in 1885.

O'HARA, ō-hār'ā, THEODORE (1820-67). An American poet and soldier, born in Danville, Ky., February 11, 1820. After being educated at Bardstown, he studied law, was admitted to the bar, got an appointment at Washington, entered the army at the beginning of the Mexican War, and was brevetted major for gallantry. Afterwards he practiced law, filibustered in Cuba, performed diplomatic commissions and filled editorial posts, and in the Civil War served as colonel of an Alabama regiment and on staffs. After the war he engaged in the cotton business, but he suffered reverses. His body was removed to Kentucky and buried by the side of the victims of Buena Vista whom he had commemorated in his famous "Bivouac of the Dead," the only one of his occasional poems that keeps his memory fresh.

O'HIGGINS, ō-ē'gēns. An inland province of Chile, bounded by the Province of Colchagua on the south, Santiago on the north and west,

and Argentina on the east (Map: Chile, C 10). Area, 2524 square miles. The eastern part lies on the slope of the Andes and is very mountainous. In the west the surface is flat and well adapted for grazing, which, together with agriculture, is the chief occupation. Gold and other metals are found in the mountains. Population, in 1895, 85,277. The capital is Rancagua (q.v.).

O'HIG'GINS, *Span. pron. ō-ē'gēns*, AMBROSIO (c.1730-1801). A South American governor. He was born in County Meath, Ireland, and his original name was Ambrose Higgins; was sent by his uncle, a priest in Spain, to Buenos Ayres; there he set up as a peddler and finally crossed the country and settled in Chile. He entered the Spanish army, rose rapidly, and in 1788 received the appointment of Captain-General of Chile. The last five years of his life were spent as Viceroy of Peru, with the title of Marquis of Osorno.

O'HIGGINS, BERNARDO (1776-1842). A South American soldier, dictator of Chile. He was born at Chillan, was educated at Lima until he was fifteen and then in England, where he became intimate with Miranda; and after many strange adventures returned to Chile in 1802. He joined the patriots in 1810, and three years afterwards was appointed Carrera's successor. A breach between the two generals, which threatened civil war, seemed healed by the necessity of meeting the attack of the Spanish Army. O'Higgins, treacherously deserted by Carrera, was defeated at Rancagua (1814), and was forced to leave the country. In 1817 he returned as lieutenant of San Martin, and after the victory of the patriot army accepted the dictatorship, which his commander had refused. He was completely successful in driving out the Spaniards from Chile; but the aristocratic party distrusted his republican leanings and his attempts to introduce a liberal constitution. Under the followers of Carrera, they rebelled and deposed him in 1823. O'Higgins went to Lima, where he spent his remaining years.

OHIO (corruption of Iroquois *Ohionhio*, beautiful river), popularly called the 'BUCKEYE STATE.' A north central State of the United States, lying between 38° 27' and 41° 57' north latitude, and between 80° 34' and 84° 49' west longitude. It is bounded on the north by Michigan and Lake Erie, on the east by Pennsylvania, on the southeast by West Virginia, on the southwest by Kentucky, and on the west by Indiana. Its southeastern and southwestern boundaries are formed by the Ohio River, while the others, with the exception of Lake Erie, are straight lines. The State measures 215 miles from east to west, and 210 miles from north to south. Its area is 41,060 square miles, of which 40,760 square miles or 26,086,400 acres are land-surface. It ranks thirty-second in size among the States.

TOPOGRAPHY. The surface is a rolling plain sloping gradually northward toward Lake Erie and southward toward the Ohio River from a low and flat ridge which forms the divide between the two water systems. This ridge crosses the State in an irregular line from near the northeastern corner to about the middle of the western boundary, keeping much nearer to the lake than to the Ohio River. The elevation of the State above sea-level varies from slightly less than 500 feet to somewhat more than 1000 feet. The greatest altitude, 1540 feet, is reached near

Bellefontaine in the west-central part. There are no marked irregularities in the surface except the trenches cut by the rivers, the Ohio River valley being lined with bluffs which in some places are 600 feet high. As noted above, the State is divided into two drainage basins. The northern portion is drained into Lake Erie by a number of streams which are all short except the Maumee, which flows through the northwestern part of the State from Indiana. The southern and much larger slope is drained into the Ohio River, some of whose tributaries in this State are of considerable size. These are the Muskingum, Hocking, Scioto, and Little and Great Miami. The Muskingum is the longest river flowing wholly within the State, and is navigable for nearly 100 miles. The Ohio itself is navigable throughout its length on the boundary, a distance of 436 miles. The other rivers of the State are chiefly important for water-power, some of them being very swift.

CLIMATE. The climate is in general pleasant and healthful, though variable, and subject to great and sudden changes of temperature. The mean temperature of the State for January is 26°, and for July 73°. The maximum may reach as high as 108° and the minimum 34° below zero, but extreme heat or cold is never very prolonged, on account of the variable winds. The southern half is the warmer, the heat of the northern portion being tempered by the presence of Lake Erie. In the north the winters are more severe, though seldom very rigorous in any part of the State. The average annual rainfall is 39.35 inches, very evenly distributed through the year, though there is a maximum in May and June.

SOIL AND VEGETATION. In the southeastern part the soil is formed directly from the decomposition of the underlying rocks, while in the remaining area, covering nearly two-thirds of the State, it consists of glacial drift of great fertility. This soil contains a great percentage of limestone material in the west, while in the northeast it consists chiefly of clay, and is well adapted for wheat-growing. The alluvial soil deposited along the river courses is excellent for the raising of Indian corn. The extreme northwestern part of the State exhibits certain features of prairie country. The remainder was originally covered with forests, in which oak, chestnut, and maple predominated on the higher ground, and elm, beech, ash, and similar trees on the lowlands. The flora of the State partakes of the general character of the Northeastern United States and has few peculiar species.

For Fauna, see paragraph under UNITED STATES.

GEOLOGY. The principal feature in the geology of Ohio is the broad fold or anticlinal whose axis extends from central Kentucky and crosses southwestern Ohio near Cincinnati, thence running northwest into Indiana, while a branch axis runs northeast toward the western end of Lake Erie. From this axis the strata dip gently in either direction, so that a broad area of Silurian rocks is exposed, covering southwestern Ohio, southeastern Indiana, and north central Kentucky, with a narrower band along the branch axis toward Lake Erie. A small portion of this area near Cincinnati is composed of Lower Silurian rocks known as the Cincinnati group. On either side of the Silurian are narrower

outcrops of Devonian strata running on the one hand through central Indiana, and on the other through the whole length of Ohio a little west of the central line. The lateral outcrops of these strata along the branch axis occupy the northwestern corner of the State and a narrow belt along the entire southern shore of Lake Erie. The remainder of Ohio, including nearly the whole eastern half, consists of Carboniferous strata. The entire State seems to have been above sea level throughout the Mesozoic and Cenozoic eras, there being no formations later than the Carboniferous until we come to the glacial drift. This covers about two-thirds of the State, leaving the southeastern portion untouched by the ice invasion. The drift deposit is in some places several hundred feet thick, and consists of alternating layers of boulder clay, stratified sand, finely laminated clay, sandy clay, and gravel. Raised beaches showing the former extent of the Great Lakes have been traced through the State, and another interesting feature of the surface are the deeply carved river-valleys which are completely filled with debris, so that the rivers sometimes flow far above their former beds.

MINERAL RESOURCES AND MINING. Both the upper and lower coal measures contain several workable seams interbedded between strata of shale, limestone, sandstone, and clay, and ranging in thickness from two to over a dozen feet. It has been estimated that Ohio contains enough coal to supply the demand of the State for soft coal for 1000 years at the present rate of consumption. The interbedding strata of the coal measures yield fire-clay and building stone, and here also are found the iron ores of the carbonate variety. The Salina group of the Silurian strata near Sandusky contains valuable gypsum deposits, and salt deposits also occur at various places. One of the most remarkable events in the mineralogical development of Ohio was the discovery in 1884 of petroleum in the Trenton limestone formation of Lower Silurian age. This formation as well as the Upper Silurian enclosed also considerable reservoirs of natural gas.

Ohio's output of coal increased from about 6,000,000 tons in 1880 to 13,562,000 tons in 1892. It did not exceed this figure again until 1898. In that year and in the two following years the increase was very rapid. The output in 1900 aggregated 18,988,150 short tons, amounting to 7 per cent. of the total output for the country. It was valued at \$19,292,246. Only a small amount of the coal output is used in the production of coke. The average number of employees engaged in the coal industry in that year was 27,628.

The petroleum development has been of recent date. Little had been produced prior to 1885, which year marks the beginning of the swift progress of the industry. The yield increased from 90,081 barrels in 1884 to 661,580 in 1885, 10,010,868 in 1888, and 23,941,169 in 1896. The last is the record year. The output for 1900 was 22,362,730 barrels, valued at \$24,091,601. This was much in excess of that of any other State, and was over one-fourth of the total output for the United States. The petroleum is obtained in two sections of the State, the southeast and northwest. The former is known as the Eastern district, and the latter—the more important—as the Lima district. In a third region, known

as the Mecca-Belden district, small quantities of lubricating oil are obtained. The utilization of the State's natural gas resources is also of recent development. There are two gas fields corresponding in a general way with those of petroleum. The extensive use of gas for fuel began in the Eastern district in the early seventies. The value of the gas burned in 1880 was estimated at over \$5,000,000. The product was extravagantly consumed, and the supply soon became exhausted, so that in 1885 the value of the product was only about \$100,000. The development of the gas fields in the northwest part of the State began at Findlay about this time, and the value of the output rapidly increased until 1889, when it exceeded that of any previous year. After 1889 the output declined steadily until 1898, since when its value increased again, amounting in 1900 to \$2,178,234. From 1890 to 1900 the State was exceeded in rank with respect to the output of natural gas by Pennsylvania and Indiana, and since 1899 by West Virginia.

Ohio ranks first in the annual value of clay products, contributing 17.3 per cent. (1900) of the total output for the country. Their value increased from \$10,860,934 in 1890 to \$18,504,628 in 1900. Of the latter amount, \$8,573,323 represented the value of the pottery (see *Manufactures*), and \$9,731,305, the brick and tile. The State regularly ranks first in the figures for the sandstone product. From an annual value of over \$3,000,000 in the earlier years of the decade 1890-1900, Ohio's product fell to about half that amount, but rose in 1900 to \$2,233,596, including grindstones and whetstones. Of these it produces over four times as much as all the rest of the country, the value for 1900 being \$549,636. The output of limestone for the same decade fluctuated in value around \$1,500,000, approximately half the product being burned into lime. Considerable quantities of cement are annually manufactured. Iron ore was mined at an early period, and was of great importance to the industrial development of the State. Recently, however, iron-mining has become of less importance, both relatively and absolutely. From 344,484 tons in 1886 the output fell gradually to 61,016 tons in 1900, the entire product being of the carbonate variety of ore, and giving Ohio first rank in the production of carbonate ore. In 1900 sales of mineral water were reported from fifteen springs. In the same year the production of salt amounted to \$696,326, giving the State fourth rank.

FORESTS AND FOREST PRODUCTS. The greater part of Ohio was originally covered with forests of hard wood, largely white oak. Scarcely any of the primeval forests remain. The wooded area in 1900 was estimated at 9300 square miles, or 23 per cent. of the total area. The value of the lumber and timber products (see table below) was greater for 1900 than for any previous census year. The abundance of forests early gave rise to a number of industries, such as the manufacture of planing-mill products, furniture, etc., which have continued important, although much of their timber supply is now imported from other States.

AGRICULTURE. There is little waste land in the State. In 1900, 93.9 per cent. of the total land area was in farms. The proximity of large city markets and the excellence of the trans-

portation facilities help to stimulate agriculture. Every decade from 1850 to 1900 shows an increase in the area of improved land, which amounted in both 1890 and 1900 to 78.5 per cent. of the total farm area. The average size of farms decreased from 125.2 acres in 1890 to 88.5 acres in 1900. The farms operated by tenants in 1900 were 27.5 per cent. of the total number. Farm renting is becoming more common. The farms leased on share are more than twice as numerous as those leased for cash.

From the table appended it will be noticed that no particular agricultural products receive a monopoly of attention. In the variety of its farm yield the State has ranked high since the first settlement of the West. The staple products are grown throughout the State, there being only a slight difference in the adaptability of the different sections. The area of corn, wheat, and hay each exceeds three million acres, though the two last attained that record for the first time in 1900. From 1890 to 1900 the acreage of wheat increased 41.4 per cent. and the acreage of corn 20 per cent. Oats are also extensively grown, but this crop decreased in area during that decade. Rye, barley, and buckwheat are not extensively raised. Ohio is one of the largest producers of Irish potatoes, and the large city markets have given rise to the extensive raising of other varieties of vegetables—sweet corn, tomatoes, and cabbage being particularly important. The area devoted to tobacco increased 61.2 per cent. from 1890 to 1900, the rank of the State in 1900 being fourth. Over 43 per cent. of the area devoted to tobacco in 1900 lay in the counties of Montgomery and Darke. Ohio is probably the largest producer of temperate zone orchard fruits. Fifty-nine per cent. of the trees, or 12,952,625, are apple. The yield of this crop in 1900 was 20,600,000 bushels. The number of peach and pear trees was three times, and of plum and prune trees six times, as great in 1900 as in 1890. The region around Lake Erie is especially favored for fruit-raising. This region has become noted for its numerous and extensive vineyards. Large quantities of small fruits are grown. The use of fertilizers, estimated on the basis of cost, increased 68.2 per cent. from 1890 to 1900, amounting in the latter year to an average of \$10 per farm.

The following table of crop acreages is self-explaining:

CROP	1900	1890
Corn	3,826,013	3,189,553
Wheat	3,209,074	2,269,585
Oats	1,115,149	1,215,355
Rye	17,585	59,643
Buckwheat	13,071	14,052
Barley	34,058	37,092
Hay	3,015,261	2,992,036
Tobacco	71,422	44,303
Potatoes	167,590	185,393

STOCK-RAISING. Stock-raising is characterized by the same diversity as is the cultivation of crops. Ohio holds a prominent place in dairying. The number of dairy cows has increased each decade since 1870. The production of milk gained 30.3 per cent. from 1890 to 1900. The receipts from sales of dairy produce in 1900 were \$15,484,849, or 61 per cent. of the value of the total product. Of this amount, \$8,303,626 was derived from the sale of milk, and most of

COPYRIGHT, 1881 AND 1903, BY DOOB, MEAD & COMPANY.

the remainder from butter. The State is noted for sheep-raising, having for a long time led in the number of sheep, but there was a large decrease from 1890 to 1900. The average weight of fleeces, however, increased in this last decade, and in 1899 \$4,299,025 was received from sales of wool. There was a significant gain from 1890 to 1900 in the number of cattle. The number of swine has remained about the same since 1880. Poultry is an important source of income.

The following table of holdings of stock explains itself:

	1900	1890
Dairy cows.....	818,239	794,833
Other cattle.....	1,235,074	968,654
Horses.....	878,205	890,677

Sheep.....	2,648,250	4,050,729
Swine.....	3,188,563	3,275,922

MANUFACTURES. Until 1880 Ohio ranked fourth in the United States in the value of manufactured products, being exceeded in that year for the first time by Illinois. It has since held fifth place. The greatest absolute increase both in the value of products and the number of wage-earners employed was made between 1880 and 1890. In 1900 the value of products was estimated at \$832,438,000, and the wage-earners numbered 345,869, or 8.3 per cent. of the population.

The early settlers were mainly from the Atlantic coast States, and brought with them a knowledge of industrial methods which enabled them to begin at once a diversity of industries for the supplying of local needs. The local requirements were soon outgrown, however, in consequence largely of the superior advantages of transportation, which gave the industries easy access to the resources of raw materials outside the State, and to the markets of an extensive and rapidly developing region. The Ohio River on the south afforded communication with the States of the Mississippi Valley. Lake Erie on the north gave the State the advantages of the lake system of transportation, and, after the building of the Erie Canal, afforded communication with the Atlantic coast. The two systems of transportation were early connected by two canals, and these waterways determined the location of the early industrial centres, three of which, Cincinnati, Cleveland, and Toledo, were especially favored by their positions at the junction of the artificial with the natural waterways. They still hold their industrial precedence.

From 1800 to 1850 Cincinnati not only far surpassed all other cities in the State, but was the metropolis of the West. From 1890 to 1900, however, there was a decrease in both the value of its products and the number of its wage-earners. Cleveland by contrast has rapidly grown, and now surpasses all Ohio towns in importance as to manufactures. What has brought Cleveland and other cities in the northeastern part of the State into recent prominence is the advantage they enjoy in the manufacture of iron and steel. This has become the State's leading industry. The first iron and steel establishment was in this section of Ohio, but as the forests, which supplied the charcoal used as fuel, became exhausted,

the industry shifted to the southern part. The revival of iron and steel manufacture in the northeastern part was due to the development of the Lake Superior iron mines and the easy transportation afforded by the Great Lakes to this section of Ohio, together with the fact that the coke-producing regions of Pennsylvania were near. Youngstown, near which place the industry originated, has become the largest producer of iron and steel in Ohio. Since 1870 the State has ranked next to Pennsylvania, and between 1890 and 1900 its product more than doubled in value. The closely allied tin andterne-plate industries are also rapidly developing. The prominence of the iron and steel industry and the convenient resources of coal have exercised a beneficial influence on the manufacture of foundry and machine-shop products—the second largest industry in the State. This branch early attained large proportions at Cincinnati, which city was favored by its location on the Ohio River and its nearness to the coal and iron regions farther east. The industry has since developed generally throughout the State, Cleveland having become the largest centre. From 1890 to 1900 there was a gain of 66 per cent. in the value of the product. In the construction of merchant vessels Cleveland now ranks first among the cities of the United States.

In 1900 Ohio led all States in the manufacture of metal-working machinery. The large steam railway interests have led to an extensive car and general shop construction industry, and the increased use of electricity has occasioned a rapid development in the manufacture of electrical apparatus and supplies. From the first the preëminence of Ohio in agriculture has been a potent factor in manufacturing, having created a market for certain products, and supplying raw materials for others. A number of towns are best known by their manufacture of agricultural implements and wagons and carriages. The local iron and steel supply and the native forests within or near the State boundaries have afforded the chief raw materials required. The products of the farms in turn have occasioned a large slaughtering and meat-packing output, extensive manufactures of liquors, and a large production of flour, grist and tobacco products, and food preparations. In 1900 Ohio ranked third in the value of flour and grist-mill output, and also in the value of liquor products. Toledo ranks first in the production of the former, and Cincinnati in that of the latter. Cincinnati is also the largest centre of the slaughtering and tobacco interests. Being located close to the junction of the three largest swine-raising States, Cincinnati was, from 1800 to 1850, the largest meat-packing centre in the United States. The importance of the tobacco manufacture of that city is due to the fact that it is surrounded by one of the largest tobacco-growing regions in the United States. Akron is the chief producer of food preparations, an industry which enjoyed a sixfold increase from 1890 to 1900. Other industries which depend upon the resources of the State include the manufacture of glass, pottery and other clay products, and the refining of petroleum. When the natural gas supply partially failed, some of the glass factories removed to the Indiana gas fields. The value of the output for Ohio has therefore decreased. The value of the pottery products, on the con-

trary, more than doubled during the decade ending with 1900. East Liverpool, on the Ohio River, produces nearly one-half of the white

the percentage of the value of products has increased much more than that of the number of establishments:

	1890	50	2,921	7,209,750

were manufactured in the United States. Yellow ware is manufactured at Zanesville and other points.

The manufactures of clothing, boots and shoes, leather, and rubber and elastic goods are all important. The value of the boots and shoes manufactured in 1900 was twice that for 1890, and the value of the rubber and elastic goods increased fivefold during the same period. Ohio has always been the largest boot and shoe manufacturing State west of the Alleghany Mountains, and only three cities, all located in Massachusetts, rank in this line ahead of Cincinnati.

The following table with respect to the leading industries explains itself. It will be seen that

TRANSPORTATION AND COMMERCE. Ohio ranks fifth in its total railroad mileage; and in its mileage per 100 square miles of area—21.61 miles—it is exceeded by only one other of the large States. The first railroad built in Ohio, the Mad River and Lake Erie, now a part of the Big Four System, was chartered in 1832. By 1850 the mileage had increased to 572 miles; in 1870, 3538 miles; in 1890, 7980 miles; and in 1900, 8885 miles. In 1901 there were 100 railroad companies represented in the State. Among the longer lines were the Baltimore and Ohio Southwestern, the Cincinnati, Hamilton and Dayton, the Cleveland, Cincinnati, Chicago and Saint Louis, the Hocking Valley, the Lake Shore

and Michigan Southern, the New York, Chicago and Saint Louis, the Pittsburg, Cincinnati, Chicago and Saint Louis, the Toledo and Ohio Central, and the Wheeling and Lake Erie. In recent years there has been a decided tendency toward centralization of the railroads. In 1901 there were 858,815,080 passengers carried one mile; the average distance which passengers were carried was 25.73 miles; and the average receipt per passenger per mile was \$.025. In the same year there were 12,450,261,839 tons of freight transported one mile, the average distance haul per ton being 72.18 miles, and the average amount received per ton mile \$.013. Ohio leads every State in the extent of its interurban electrical railways. It is now possible to cross the northern part of the Commonwealth on electrical lines, or to go from Newark to Cincinnati. Cleveland, Toledo, Columbus, and Dayton are important centres for electrical lines.

Ohio has three United States customs districts, of which the ports of entry are Toledo, Sandusky, and Cleveland. Cincinnati also is a port of entry in the district of Louisiana for the State of Ohio. These customs ports represent only the foreign imports and exports which the position of Ohio on the lakes, adjoining Canada, and in communication with ocean commerce through the Canadian canals and the Saint Lawrence, enables the local merchants to make direct to and from foreign countries. The same may be said of Cincinnati, though its foreign trade has to be carried much more indirectly through the Ohio and Mississippi rivers. The foreign commerce of Ohio is, however, insignificant compared with the vast domestic commerce east, west, north, and south, along the State's lakes, railways, canals, and great river. Lake Erie is still the greatest single highway of commerce for the State, and the Government has improved several of its harbors. Those at Cleveland and Sandusky are the finest in the State. Sandusky Bay extends inland about eighteen miles, and admits the largest lake vessels to wharf. Cleveland figures most prominently in the lake commerce. Formerly the canals were expected to be second only to the lake and the Ohio River in volume of commerce, but the railways have far surpassed them in carrying facilities. The great value of the canals is now to force low rates upon the railway system by their cheaper, though slower, transportation. The canals now operated comprise the Ohio Canal, completed in 1835, extending from Cleveland to Portsmouth, 309 miles long; the Miami and Erie Canal, completed in 1835, extending from Cincinnati to Toledo, 250 miles long; the Hocking Canal, a branch of the Ohio, completed in 1843, extending from Carroll to Nelsonville, 42 miles long; and the Walhonding Canal, completed in 1843, extending from Rochester to Roscoe, 25 miles long. There is also a large mileage of artificial feeders and slack-water navigation.

BANKING. In 1803 a trading company was chartered with the privilege of doing a banking business. From 1808 to 1813 five more banks were incorporated, each by a special act of the Legislature. The banks did a prosperous business, and when in 1817 a branch of the first United States Bank was established in Cincinnati it called forth strong opposition. The State made an effort to drive out this branch by special taxation, but was defeated in the United States Supreme Court.

Some 25 banks were established in the following twenty years, and when in 1836 the second United States Bank made an effort to establish a branch, a special act was passed prohibiting it. A large number of unauthorized banking institutions sprang up between 1840 and 1850, and their currency flooded the State. Several of them failed and caused losses to the holders of currency. To correct the evil, the State in 1845 strictly prohibited any one from engaging in the banking business without special authority of the State; but the law did not prove sufficient, and in 1851 the State was forced to pass a free banking law. In 1863 almost all the State banks became national. Since then the national banks have remained the more popular. In the panics of 1873, 1884, and 1893 the numerous bank failures were practically limited to the private and State banks. A reaction in favor of State banks came toward 1900, when the high prices of the United States bonds made the advantages of national banking unattractive. Savings banks have existed in Ohio since 1850, but the institutions do also a commercial business.

The condition of the various banks in 1902 is shown in the following table:

	National banks	State banks	Private banks	Savings banks
Number.....	211	226	91	4
Capital.....	\$50,545,000	\$24,829,000	\$4,380,000	
Surplus.....	16,856,000	5,904,000	844,000	\$2,437,000
Cash, etc.....	22,455,000	7,156,000	1,891,000	743,000
Deposits.....	185,468,000	142,918,000	20,246,000	48,180,000
Loans.....	202,388,000	114,161,000	18,128,000	15,798,000

FINANCES. The first debt of the State was created in 1825, when the construction of several important canals was begun. In 1835 the debt amounted to \$4,500,000. The State continued to subscribe to railroad, turnpike, and canal companies, until in 1843 it had a public debt of \$16,880,000, in 6 and 7 per cent. bonds, and interest charges of \$1,022,000. Simultaneously with the loans, the State established a system of taxation to meet the charges. All the income from the canals and a special tax were pledged for that purpose. These measures kept the credit of Ohio high and enabled it to borrow further sums. In the financial stringency of 1838-40, however, borrowing became more difficult, and as the abandonment of work would have meant too great a loss, 7 per cent. bonds had to be issued in 1843. But the law authorizing this loan also closed up all means of further increase of the debt. The sinking fund, the proceeds from sale of lands, and the school fund were absorbed by the canals. The debt was then gradually reduced and in 1856 it was \$13,897,242. During that year, however, \$2,423,349 more was borrowed, after which the debt was rapidly reduced by redemption of several hundreds of thousands of dollars each year. In 1880 the debt was only \$6,476,805; a greater part of these bonds were acquired by the school fund and so became irredeemable. Of the redeemable debt only \$2,541,655 was left in 1890, and in 1902 only \$200,000—maturing in 1903. The income of the State was always derived mainly from direct taxation and was divided between the general revenue fund, sinking fund, and school fund. In 1892 a special university fund was created. In 1902 the total income was \$9,855,524, of which almost 60 per

cent. came from a general property tax and $17\frac{1}{2}$ per cent. from an excise tax. The expenses were \$7,967,003. The balances in all the funds on November 15, 1902, amounted to \$3,572,244.

GOVERNMENT. Ohio has its second Constitution, the one now in operation having been adopted by a popular vote in 1851. An amendment proposed in either House must be approved by three-fifths of the members elected to each House, and in turn by a majority of the electors voting at a popular election, each amendment being voted upon separately. A constitutional convention may be called if demanded by two-thirds of the members elected to each branch of the General Assembly, and by a majority of all the electors voting at a popular election. The question 'Shall there be a constitutional convention?' is voted upon at a popular election each twentieth year and determined by a majority of all the electors voting. The exercise of the franchise has the usual limitations of age, sex, and sanity, and the requirement of a residence of one year in the State and such time in the county, township, or ward as may be provided by law. The Legislature may deny the right of suffrage to persons convicted of bribery, perjury, or other infamous crime. The registration of voters is required in cities of not less than 9000 inhabitants. The State sends 21 members to the National House of Representatives.

LEGISLATIVE. The General Assembly consists of a Senate and a House of Representatives. Representation is upon the basis of population. Most of the counties have one or more members in the Lower House, the smaller counties being united with other counties for representation. The members of both Houses are elected for two years, the day of election being the same as that for executive officers—the first Tuesday after the first Monday in November. The Legislature meets in regular session biennially the first Monday of January, in even-numbered years. The number of Senators and Representatives is determined biennially. Counties are united for Senatorial representation, but any county may be made a separate Senatorial district when it has acquired a population equal to a full Senatorial ratio, providing, however, that a full Senatorial ratio is left in the district from which it is removed. The compensation of the members of the General Assembly is fixed by law. The Lower House impeaches and the Senate tries all cases of impeachment, the concurrence of two-thirds of the Senators being necessary to a conviction. Bills may originate in either House, and no bill may contain more than one subject.

EXECUTIVE. The term of the Governor, Lieutenant-Governor, Secretary of State, State Treasurer, and Attorney-General is two years; that of the Auditor four years; and that of the school commissioner, and of the board of public works, three years. The commissioner of railroads and telegraphs, superintendent of insurance, supervisor of public printing, gas commissioner, and State and law librarians are appointed by the Governor.

The Governor may call extra sessions of the General Assembly. He exercises the usual pardoning power, subject to regulations as to the manner of applying for pardons.

The Lieutenant-Governor, president of the Senate, and Speaker of the House are in the line

of succession to the Governorship in case of a vacancy.

JUDICIAL. The judicial power of the State is vested in a Supreme Court, circuit courts, courts of common pleas, courts of probate, justices of the peace, and such other courts inferior to the Supreme Court, as the General Assembly may from time to time establish. The officials here mentioned are all elected by popular vote. The term of service for the Supreme Court judges cannot be less than five years, that for the judges of the common pleas is five years, and that of the probate court judges and the justices of the peace is three years. The term of the circuit judges is determined by law. The General Assembly may establish courts of conciliation, and prescribe their powers and duties, but their judgment is not final except upon agreement of the parties to abide by such judgment.

LOCAL GOVERNMENT. The General Assembly may provide for the organization of cities and incorporated villages by general laws, and variously restrict their powers. Similarly, provision is made for the election of such county and township officers as may be necessary, the day of election for county officers being the same as that for State officers. Their terms of office do not exceed three years. No person is eligible to the office of sheriff or county treasurer for more than four years in any period of six.

LAWS. The legal rate of interest is 6 per cent., but 8 per cent. is allowed by contract. Willful absence or habitual drunkenness for three years, extreme cruelty, imprisonment in penitentiary, divorce procured by either party in another State, are some of the chief causes for divorce. Residence required, one year.

MILITIA. The men of militia age in 1900 totaled 893,327. The militia in 1901 numbered 6001.

POPULATION. The following figures show the growth of the population: 1800, 45,365; 1820, 581,295; 1840, 1,519,467; 1860, 2,339,511; 1870, 2,665,260; 1880, 3,198,062; 1890, 3,672,316; 1900, 4,157,545. From eighteenth in rank in 1800 Ohio rapidly advanced to third in 1840, which position it held until surpassed by Illinois in 1890, since when it has been fourth. The greatest absolute increase was made in the decade 1830-40. From 1890 to 1900 the increase amounted to 13.2 per cent., as compared with 20.7 for the United States. The earliest development of the State was along the Ohio River, many of the early settlers coming from the Southern States. But the great bulk of the population in the later developing central and northern portions came from Pennsylvania and the Northeastern States. Ohio, particularly the southern part, attracted large numbers of the early German and Swiss immigrants, and Cincinnati became well known for its large German population. In 1900 the Germans constituted over half of the 458,734 foreign-born population. In the same year the negroes numbered 96,901. The increase between 1890 to 1900 was almost wholly on the part of the urban population. Only two States have a larger number of places containing over 4000 inhabitants. The 83 towns of this size in 1900 together had 44.8 per cent. of the State's population. There is an average of 102 persons to the square mile, which figure exceeds that for any other State west of the Alleghany Mountains.

In 1900 the population of the nine largest cities was: Cleveland, 381,768; Cincinnati, 325,902; Toledo, 131,822; Columbus, the capital, 125,560; Dayton, 85,333; Youngstown, 44,885; Akron, 42,728; Springfield, 38,253; Canton, 30,667.

RELIGION. The principal denominations are the Methodists, with about one-fourth of all the church members of the State, the Presbyterian, with about one-tenth, and the Roman Catholics, with about one-tenth. Other denominations, in order of their importance, are the Lutheran, the Baptist, the Disciples of Christ, the Congregational, and the Protestant Episcopal.

EDUCATION. The first grant of land for public education in the territory of Ohio was made in 1785, when the Continental Congress reserved for that purpose the sixteenth section of every township. These grants were supplemented later by similar grants in the Virginia and United States military reservations and the Connecticut Reserve. In 1825 a school tax law was passed, and in 1827 provision was made for the sale of the school lands. A general school law was passed in 1873 providing for the classification of school districts, and making the use of the English language obligatory in teaching all branches, instead of German, which had hitherto been used in many schools.

During the second half of the nineteenth century Ohio was in many respects the leading State in the West with regard to education, and some of the most important educational reforms in the United States were first introduced here. School attendance is compulsory between the age of eight and that of fourteen. Considerable progress has been made of late in Ohio in the centralization of rural schools, with the result that there has been an increase in the number of high and graded schools, as well as in the regularity of attendance. The cost of maintaining the schools under the new system, including transportation, is in some cases less than under the old system. The census of 1900 gives the illiterate population of Ohio as 4 per cent. of the total population of ten years and over, being 2.4 per cent. for native white, 11.1 per cent. for foreign white, and 17.8 per cent. for colored. The total school age population (six to twenty-one) in 1901 was 1,219,919, of whom 829,857 were enrolled in the public schools. The average attendance in the same year was 610,622, or nearly 74 per cent. of the total enrollment. The length of the school term averages 163 days. The male teachers constituted 39.2 per cent. of all instructors in 1901. The average salaries of teachers were \$40 for males and \$35 for females.

The school revenue is derived from State and local taxes, fines and penalties, and various other sources. The State contributions consist of the general State tax of one mill and the interest (6 per cent.) on the money obtained from the sale of the school lands and held by the State as an irreducible State debt, amounting in 1901 to \$3,978,705. In 1901 the total school revenue was \$14,237,752, of which \$11,351,987 was obtained from local taxes, \$1,783,258 from State taxes, and \$242,257 from the income of the permanent fund. The average expenditure per pupil of average attendance in the same year was \$23.33. Public kindergartens are found in all the larger cities. For the preparation of teachers there are a number of State and private normal schools. Some of the colleges and the

universities also give courses in pedagogy. Ohio has more public high schools than any other State, though New York has a greater high school attendance. In 1901 there were in Ohio 899 public high schools, with a total attendance of 41,909. The Case School of Applied Science (q.v.) ranks among the leading technological schools in the United States.

The best known of the academic institutions are the State University, at Columbus; Oberlin College (nonsect.), at Oberlin; Western Reserve University (nonsect.), at Cleveland; and the University of Cincinnati (city), at Cincinnati. Among the other higher institutions are Miami University (State), at Oxford; Ohio University (State), at Athens; Ohio Wesleyan University (M. E.), at Delaware; University of Wooster (Presb.), at Wooster; Hiram College (Christian), at Hiram; Marietta College (nonsect.), at Marietta; Kenyon College (P. E.), at Gambier; Saint Xavier (R. C.), at Cincinnati; Mount Union College (State), at Alliance; German Wallace College (M. E.), at Berea; Denison University (Bapt.), at Granville; Muskingum College (U. Presb.), at New Concord; Wittenberg College (Luth.), at Springfield; Heidelberg University (Reformed), at Tiffin; and Otterbein University (U. B.), at Westerville. Most of these institutions are coeducational.

CHARITABLE AND PENAL INSTITUTIONS. The State Board of Charities, consisting of six unsalaried members, is appointed by the Governor. This board investigates the whole system of public charitable and correctional institutions, including 17 State institutions, 8 workhouses, 89 infirmaries, 88 county jails, over 50 children's homes, and all municipal institutions and lock-ups. The plans for all new buildings, additions, or alterations must be submitted to the board for its criticism and approval. The following table includes the 17 State institutions for the year ending November 15, 1901:

INSTITUTION	Location	Daily Average number in institution	Current expenses, including salaries
State Hospital.....	Athens.....	997	\$127,435
" ".....	Cleveland..	1,121	184,710
" ".....	Columbus..	1,367	200,287
" ".....	Dayton....	837	138,383

State Reformatory.....	Mansfield..	339	89,979
Total State Institutions.		15,884	\$2,606,615

In the same year municipal institutions, comprehending eight workhouses and one house of refuge, had a daily average attendance of 1609, and total expenses of \$246,543. The expenses for county institutions for the same period, including infirmaries, children's homes, jails, outdoor relief, as reported by infirmiry directors (\$232,209), and as reported by township clerks (\$261,285), and by the soldiers' relief commis-

sion, aggregated \$2,182,720. The total State municipal and county expenses for the year were \$5,034,886. Petty criminals are committed to work-houses or to jails, the commitments to the former in 1901 numbering 813, to the latter 1627. No employment is afforded to those committed to the county jails. The State has a cumulative sentence law, but it is not enforced. The State Reformatory at Mansfield has the benefit of a parole law, and a 'field officer' is appointed to look after paroled men. Convicts at the penitentiary are employed under the peace-price and the contract systems, but the prisoners remain in the complete control of the State. At Dayton is located a National Soldiers' Home with accommodations for about 6000 inmates.

HISTORY. Ohio was formed from a part of the Northwest Territory (q.v.), and includes a portion of the Virginia cession of 1784 and all of the Connecticut cession of 1800. The first explorers cannot be surely determined. Possibly La Salle, about 1670, visited the region, but he left no record of his wanderings. The enmity of the Iroquois kept the French away from Lake Erie long after they had explored the other great lakes, and though large numbers of *couteurs des bois* roamed the wilderness and trading posts were doubtless established, not one resulted in a permanent settlement. About 1686 Governor Dongan of New York sent trading expeditions into the region with but little success. In 1749 a French officer, Céloron, under the orders of Gallissomniere, Acting Governor of Quebec, crossed Lake Erie, put his boats into the Allegheny, and thus reached the Ohio and the Mississippi. His report is the first authentic relation of this part of the country. At several points he placed tablets declaring all the region of the Ohio to be French territory regardless of the grants of the Stuart kings. English traders were driven out, and this precipitated the French and Indian War. (See OHIO COMPANY.) By the Peace of Paris in 1763 the French possessions east of the Mississippi passed to Great Britain. During the Revolution the only settlement within the present limits of the State, consisting of some Moravian villages near the present site of New Philadelphia, was broken up by Indians and renegade whites. After the Northwest Territory was formed, settlement was rapid. Massachusetts pioneers founded Marietta in April, 1788. John Cleves Symmes, of New Jersey, bought a large tract between the Miami rivers and sent out settlers. In 1788, too, a party from Lexington, Ky., founded Losantiville (now Cincinnati) on a portion of this tract. A French settlement was made at Gallipolis in 1789 or 1790, and about the same time Virginians began to come in large numbers. A provision in the Ordinance of 1787 allowed the creation of a representative assembly when 5000 white males of voting age should be resident in the territory. The first session of such an assembly was held at Cincinnati in 1799, and William Henry Harrison was chosen the first delegate to Congress. In 1800 Connecticut completely abandoned her jurisdiction over the territory along Lake Erie, though she still retained proprietary rights in the soil. This was called the Western Reserve (q.v.) and rapidly filled with settlers chiefly from New England. In May, 1800, the Territory was divided and the western part was named Indiana.

On April 30, 1802, Congress authorized the election of delegates to a convention to determine whether a State government should be established. The convention sat at Chillicothe, November 1-29, and adopted a constitution, which was not submitted to the people. The boundaries were fixed, according to the suggestion of Congress, as the Pennsylvania line on the east, the Ohio River on the south, a north and south line from the mouth of the Big Miami to its intersection with an east and west line passing through the most southerly point of Lake Michigan on the west, and this east and west line through Lake Erie to the Pennsylvania line on the north. A proviso was inserted, however, that if this northern line should touch Lake Erie south and east of the mouth of the Maumee, the northern line should then run from Lake Michigan through the mouth of this stream. Such was found to be the case later and Michigan refused to give up claim to the strip of territory including Toledo until it was made a condition of her admission as a State in 1834. An election for members of the Legislature was ordered for January 11, 1803, and the Legislature met on March 1st. Meanwhile, on February 19th, Congress declared that Ohio, by adopting a constitution, had become a State of the Union, though there was as yet no State Government. The capital was fixed at Chillicothe and so remained until 1810, and was then moved to Zanesville. In 1812 the offer of a land company to build a new city was accepted, and since 1816 Columbus has been the seat of government. Considerable excitement was caused by the alleged Burr-Blennerhasset plot in 1806. During the War of 1812 the occupation of Ohio by the British was prevented by Gen. William Henry Harrison. Many Indians joined the British, but the combined forces were defeated, October 5, 1813, on the river Thames in Canada, and Tecumseh, the Indian leader, was killed. This battle, following close upon Perry's victory on Lake Erie, ended the war, so far as this State was concerned. The population steadily increased, but the lack of a market for the products of the State was the greatest need. Some sea-going vessels had been built upon the Ohio, but such sailing vessels were worth little on rivers. The application of steam to navigation, the construction of the Erie Canal, and the completion of the Miami and Ohio canals in 1835 made a new era. From that time access to the sea was comparatively easy and the country entered upon a period of magnificent prosperity, to which the coming of the railroads gave an additional impetus.

The State supplied more than its quota of troops for the Mexican War, and at the outbreak of the Civil War was exceedingly active. Seventy regiments responded to the first call for troops, though only thirteen were asked. Soldiers were sent into Virginia and helped to save West Virginia to the Union, and the prompt action of Governor Dennison had its influence upon Kentucky also. There were many Southern sympathizers in southern Ohio, however, and resistance was offered to national officers in 1863, when the advantage seemed to be with the Confederate armies. (See VALLANDIGHAM, CLEMENT L.) A large number of the most successful Federal officers were natives of the State, as Grant, Sherman, McDowell, Rosecrans, Garfield, and others.

Ohio was Democratic in national elections from

the time of its admission to 1836. In that year it voted with the Whigs, and since then has been Whig and Republican, with the exception of the years 1848 and 1852, when it cast its vote for Cass and Pierce respectively. The following have been the Governors of Ohio:

GOVERNORS OF THE NORTHWEST TERRITORY.

Arthur St. Clair.....	1788-1802
C. W. Byrd (acting).....	1802-03

STATE GOVERNORS.

OHIO COMPANY. In American history, the name applied to two companies organized for the purpose of exploiting and making settlements in the Ohio Valley. The first was an association of prominent Virginia planters and some London merchants, and was organized in 1749. It received from George II. a grant of 500,000 acres

of land lying chiefly south of the Ohio River, in what is now West Virginia. Thomas Lee, president of the Virginia Council, was the originator of the scheme, and Lawrence Washington, a brother of George Washington, was one of the leading members. In 1772 the Walpole Company secured from the King a grant of the whole territory southeast of the Ohio from the Pennsylvania boundary to a point opposite the mouth of the Scioto. The Ohio Company now became merged in the Walpole Company. A second company, known as the 'Ohio Company of Associates,' was formed at Boston in March, 1786, by officers and soldiers, chiefly of the Massachusetts, Connecticut, and Rhode Island lines, for the purchase and settlement of Western lands. Gen. Rufus Putnam, Samuel H. Parsons, and Manasseh Cutler were chosen as directors, and the lands selected for purchase lay along the Ohio River on both sides of the Muskingum. After considerable delay the company secured a grant upon favorable terms from Congress and the contract was formally signed in October, 1787, by the Treasury Board of Congress and by Dr. Cutler and Winthrop Sargent, acting as agents of the Ohio Company. In December, several companies of surveyors, carpenters, smiths, farmers, and others, under the leadership of General Putnam, emigrated to the new territory, arriving in April, 1788. Opposite Fort Harmer they laid out a town which was named Marietta in honor of the French Queen, Marie Antoinette. Consult: King, *History of Ohio* (Boston, 1888); and McMaster, *History of the People of the United States*, vol. i. (New York, 1883). See OHIO.

OHIO RIVER. The most important affluent of the Mississippi River in point of the amount of commerce, and the longest tributary excepting the Missouri (Map: United States, J 3). It is formed by the junction at Pittsburg of the Allegheny and Monongahela rivers, and is navigable, excepting at the lower stages of water, from Pittsburg to its confluence with the Mississippi, 975 miles. After leaving Pennsylvania it flows between Ohio, Indiana, and Illinois on the right, and West Virginia and Kentucky on the left. Its drainage basin is over 200,000 square miles, and the rainfall over the basin averages 43 inches a year. Its discharge of water averages 158,000 cubic feet a second, surpassing that of the Missouri by nearly 40,000 cubic feet. The elevation of the river above the sea is 1021 feet at Pittsburg and 322 feet at its mouth. Its mean rate of flow is 3 miles an hour, and its mean fall is about .70 of a foot to the mile. The Allegheny and Monongahela are regarded as having equal claims as the source of the river, though the Allegheny is longer, with 123 miles of navigation. The Allegheny rises on the plateau of northern Pennsylvania west of the Alleghany Mountains, drains Lake Chautauqua in New York, and descends through a series of narrow valleys to its junction with the Monongahela. The latter river (navigable for 60 miles) draws its farthest supplies from the rains and melting snows of the upland Allegheny valleys in the centre of West Virginia, and in the lower part of its course passes through a valley composed of Carboniferous rocks, where coal is mined almost at the water's edge. Below Pittsburg the Ohio winds through a wide flood plain between the inclosing hills, receiving waters from the north that rise

only ten to twenty miles from the south shore of Lake Erie. The glacial drift in this north part of the Ohio basin changed the line of the water parting so that the crest of the divide between the Saint Lawrence and the Ohio basins is now ten or more miles nearer the lake than in the pre-glacial epoch. The chief northern tributary is the Wabash, a placid stream navigable by small boats to Terre Haute, Ind. Other northern affluents, as the Muskingum, the Scioto, and the Miami, descend, like the Allegheny, from the plain studded with lakes not far from Lake Erie. The southern affluents are larger, and rise, like the Monongahela, among the upland glades of the Appalachians or on the Appalachian plateau. The Kanawha (navigable to Charleston, W. Va.) and the Licking traverse salt-yielding regions. The Kentucky River (navigable to Beattyville, Ky.) joins the Ohio above the Louisville Rapids and marks the natural division between the middle and lower courses of the river. At Louisville a coral reef obstructs the Ohio with a series of rapids which disappear during the floods, but which arrested navigation at low water until the rapids were turned by lateral riverine canals. The greatest tributaries from the south are the Cumberland, navigable to Burnside, Ky., and the Tennessee, navigable to Knoxville.

Many fine towns and cities border the Ohio, the larger places standing chiefly at the mouths of the affluents. Below Louisville the valley broadens and the skirting hills retire to a great distance from the river banks. As the larger part of the drainage comes from the mountain districts, the Ohio is unable in times of very heavy rainfall or rapid thaw of the winter's snow to carry off the vast quantity of water suddenly emptied into it. The volume of its discharge has varied as much as eightfold. The difference between the high and low water marks is sometimes as much as 50 to 60 feet in a single season and in 1887 it exceeded 70 feet. The river at flood covers the lower parts of many towns on its banks, causing great loss of property and much suffering. On the other hand, in periods of drought the current is often reduced to a fordable depth above Cincinnati. These great variations in the level are a serious impediment to navigation. Boats loaded with many thousands of tons of coal and other freight destined for Ohio and Mississippi river points are frequently held up for weeks at Pittsburg waiting for enough water to float them. In spite of this drawback, the Ohio and its tributaries carry over 15,000,000 tons of freight a year, mainly coal, lumber, grain, and the product of iron and steel mills and the potteries on their banks. The total length of navigation on the river and its affluents is about 2300 miles. In the development of the West the Ohio played a prominent part.

Consult: Ellet, "Contributions to the Physical Geography of the United States," in *Smithsonian Institution Contributions to Knowledge* (Washington, 1849); Bliss, "Dr. Saugrain's Relation of His Voyage Down the Ohio River," in *American Antiquarian Society Proceedings* (Worcester, 1897).

OHIO STATE ARCHÆOLOGICAL AND HISTORICAL SOCIETY. A learned society, founded in 1875 as the Ohio Archæological So-

ciety, and reorganized and incorporated under its present name in 1885. Its object is to promote a knowledge of archæology and history, especially as relating to the State of Ohio, through the maintenance of a library and a museum, open to the public, as well as by courses of lectures and the publication of books dealing with subjects within its scope. The society is officially recognized by the State Legislature from which it receives an annual appropriation for the prosecution of its work. The membership is divided into four classes known as active members, life members, corresponding members, and honorary members. The regular annual meeting of the society is held during the month of February in the city of Columbus, unless some other meeting place be designated by the executive committee. The society issues an annual volume of *Publications* (11 vols. 1887-1902).

OHIO STATE UNIVERSITY. A coeducational State institution at Columbus, Ohio, founded in 1870 as the Ohio Agricultural and Mechanical College, and opened in 1873. The present name was assumed in 1878. The original endowment provided by the Land Act of 1862 has been supplemented by a permanent annual grant from the United States under an act of 1890, by special appropriations of the General Assembly, and by a permanent annual State grant made in 1891 and doubled in 1896. The university is organized in six colleges: Arts, philosophy, and science; agriculture and domestic science; engineering; law; pharmacy; veterinary science. Admission to the college is by certificate from accredited institutions or after examination in five groups of studies—English, history, mathematics, science, and foreign languages. The entire work of the college is arranged on the group and elective systems. It confers the bachelor's degree in course in the various departments, and the engineer's, master's, and doctor's degrees for advanced work. Military instruction and the wearing of a uniform are required of the students. The attendance in 1903 was 1717, distributed as follows: Arts, 527; engineering, 662; law, 166; agriculture, 243; pharmacy, 40; veterinary medicine, 94. The faculty numbers 133. The library contains 44,523 volumes. The university grounds consist of 345 acres, of which 235 are devoted to agricultural and horticultural purposes. A laboratory is maintained at Sandusky for summer work. The value of the property under the control of the university in 1903 was \$2,850,000, the grounds and buildings being valued at \$2,500,000. The total endowment was \$569,876, and the income \$545,909.

OHIO UNIVERSITY. A coeducational State institution at Athens, Ohio, organized in 1804, two townships of land having been set aside for the founding of a university by the terms of the purchase made from the United States Government by the Ohio Company of Associates in 1787. Besides the collegiate department, the university has schools of music and commerce, a preparatory department, and a normal college. The bachelor's degree in arts, philosophy, science, and pedagogy is given in course and the master's degree after one year's graduate work. Tuition is free. The registration in 1903 was 551, and the faculty numbered 39. The library contains 17,500 volumes. The university receives about \$7000 a year from its land endowment and about

\$70,000 by direct tax. The income for 1902 was \$85,000, and the value of the college property was estimated at \$400,000.

OHIO WESLEYAN UNIVERSITY. A co-educational institution of higher learning under the control of the Methodist Episcopal Church at Delaware, Ohio, opened in 1844. The Ohio Wesleyan Female College, founded in 1853, was united with the university, and in 1896 an existing medical school at Cleveland was annexed under the name of the Cleveland College of Physicians and Surgeons. The university embraces a college of liberal arts, an academic department, and schools of music, oratory, business, fine arts, and medicine. In 1849 the trustees authorized the sale of scholarships to secure an endowment, and during the next five years 3740 scholarships were sold, calling for more than 25,000 years of tuition. In 1902 the faculty numbered 111 and the student body 1385. The endowment was \$954,121, and the value of the grounds, fifteen buildings, and equipment, \$742,503. The library contained 42,000 volumes.

OHLAU, *Ōlou*. A town of Silesia, Prussia, 16 miles southeast of Breslau, on the Ohlau, a tributary of the Oder (Map: Prussia, G 3). The town has a gymnasium. The surrounding country is a tobacco district, so the town has large tobacco and cigar factories, and in addition manufactures of white lead, machinery, lime, wagons, bone-dust, and shoes. There are also saw-mills and brick-kilns, and the town has steamboat communication with Breslau. Ohlau was formerly a residence of the dukes of Brieg and of the Sobieskis, and in 1742 became part of Prussia. Population, in 1900, 9235.

OHLIGS, *Ōlks* (formerly *MERSCHIED*). A town in the Rhine Province, Prussia, near the Rhine, 10 miles southeast of Düsseldorf (Map: Prussia, B 3). There are manufactures of steel goods, umbrella frames, cloth, silk, and bricks. Population, in 1900, 20,682.

OHM (named after Georg S. *Ohm*). The practical unit of electrical resistance. It is defined as being the electrical resistance offered to the passage of an unvarying electric current by a column of mercury, 106.3 cm. long, of uniform cross-section, having a mass of 14.4521 grams, the mercury being at the temperature of 0° C. (This would require a cross-section of 1.00003 square millimeters.) The ohm is substantially equal to 10⁹ C.G.S. electro-magnetic units of resistance. See ELECTRICAL UNITS; RESISTANCE, ELECTRICAL.

OHM, *ŏm*, GEORG SIMON (1787-1854). A German physicist and discoverer of the famous law in electricity bearing his name. He was born and educated at Erlangen, and, after giving instruction in mathematics and physics in a number of schools, he was called in 1817 to a chair in the gymnasium at Cologne. He made a study of the laws of galvanic currents, and while investigating the relative conductivity of metals finally discovered the relation known as 'Ohm's law,' which underlies all electrical theory and measurement. The experimental proof of this law was first published in a paper in *Schweigers Journal für Chemie und Physik*, vol. xvi. (1826), under the title of "Bestimmung des Gesetzes nach welchem Metalle die Kontaktelectricität leiten," etc. An exposition of the theory is contained in *The Galvanic Chain, Mathematic-*

ally Worked Out (1854). He resigned his professorship at Cologne in 1826, was director of the Nuremberg Polytechnic School 1833-49, and was then called to the chair of physics at Munich. The name ohm was given to the unit of electrical resistance by the Paris Congress of Physicists (1881). Previously (1846) the British Association had called the unit of resistance the ohmad. See *Scientific Works of Georg Simon Ohm*, by Eugene Lommel, a biographical sketch in *Smithsonian Report*, 1891, Washington; also, Mann, *Georg Simon Ohm* (Leipzig, 1892).

OHM'S LAW. See ELECTRICITY, section on *Laws of Steady Electric Currents*.

OHNET, *ŏ'nâ'*, GEORGES (1848—). A popular French novelist and dramatist. Ohnet left law for journalism, attempted the stage with *Regina Sarpi* (1875), and began his novelistic series, "Les batailles de la vie," in 1881. Of these the most successful were: *Le maître de forges* (1882); *La comtesse Sarah* (1883); *Lise Fleuron* (1884); *Le docteur Rameau* (1888). Most of Ohnet's novels have been translated and several of them dramatized. Story and character are conventional; the tone is monotonously optimistic. But Ohnet manages commonplace material with a melodramatic skill that has won a remarkable commercial success.

OIDIUM, *ŏ-id'i-ŭm* (Neo-Lat., from Gk. *ὄν, ōn*, egg). The conidial form of certain Erysiphæ, an important family of minute fungi growing on animal and vegetable substances. The species of Oidium consist of tiny tubular white or bright colored threads, forming flocks, simple or irregularly branched, assuming in their upper part the form of strings of beads, which finally break up into elliptic spores. Oidium albicans is found on the epithelium in the mouth and throat in the disease called aphthæ, or thrush. It is more common in children and aged persons than in those who are in the prime of life. Another species, Oidium Tuckeri, which has attracted great attention in Europe, is regarded by many as producing a destructive grape disease. It is the conidial form of *Uncinula necator*, or *Uncinula spiralis*. It makes its appearance at first in the form of a mycelium of creeping, branching filaments, which send out upright or decumbent jointed stems. Each bead-like joint of the stems develops into a sort of spore, numbers of which are finally discharged in little clouds. The grape disease was first observed in Kent, England, in the spring of 1845. The disease rapidly spread over other English vineries; was observed about the same time in the vineries of Paris, and soon in the vineyards of almost all parts of France, Italy, Greece, Tyrol, and Hungary, finally, and in a slighter degree, affecting the vineyards of the Rhine. Its ravages extended to Algeria, Syria, Asia Minor, and many other countries, among which is particularly to be noted the island of Madeira, where it proved almost completely destructive to the grapes and nearly put an end to the production of the celebrated Madeira wine. It is probable that the complete isolation of the Madeira vineyards made the progress of the disease more rapid, and its result more complete than elsewhere, by reason of the prevalence of the conditions favorable for it. This disease is more fully described under GRAPE as powdery mildew, for which remedies are there suggested.

OIL-BEETLE. Any of the blister-beetles of the family Meloidæ, particularly those of the type genus *Meloe*. See **BLISTER-BEETLE**.

OIL-BIRD. See **GUACHARO**.

OIL-CAKE. The residue which remains in the press when seeds are crushed to express the oil which they contain. Oil-cake still retains a portion of the oil of the seed, along with almost all its other constituents, and is valuable either for feeding cattle or for manure. As it is too rich in proteins and fats to be given alone, it is mixed, for feeding, with hay, straw, or cereals. Sometimes the cake is ground, in which case the product is known as oil meal. The amount of oil remaining in the cake depends upon the process employed in expressing; whether by simple pressure, by pressure combined with heat, or by a solvent, as carbon disulphide or petroleum ether. From 8 to 10 per cent. of oil is now left in the cake when extracted by the latter method, but when solvents were first introduced they extracted the oil so completely as to make the cake of little value for cattle food.

The accompanying table gives the composition of a number of the most important oil cakes:

COMPOSITION OF THE MOST IMPORTANT OIL-CAKES
(From Sadler's *Industrial Organic Chemistry*)

	Water	Fat	Non-nitrogenous materials, woody fibre	Ash	Protein material	Nitrogen
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Earth-nut cake.....	11.50	8.80	31.10	7.25	41.35	6.80
Cottonseed cake.....	13.00	7.50	51.00	8.50	20.00	2.90
Rape-oil cake.....	10.12	9.28	41.98	6.48	31.88	5.00
Colza-oil cake.....	11.35	9.00	42.82	6.28	30.55	4.50
Beechnut cake.....	11.40	8.50	49.80	5.30	24.00	3.20
Linseed cake.....	10.56	9.88	44.61	6.50	28.50	4.25
Camellina cake.....	9.80	9.20	50.90	7.00	23.30	3.60
Poppy-oil cake.....	9.50	8.90	37.67	11.43	32.50	5.00
Sunflower-oil cake.....	10.30	8.50	48.90	11.40	21.00	2.40
Hempseed cake.....	10.00	8.26	48.00	12.24	21.50	3.30

Cocoonut cake.....	10.00	9.20	40.50	10.50	30.00	4.50
Sesame-oil cake.....	10.35	10.10	38.80	9.80	31.93	5.00

See **COTTONSEED AND ITS PRODUCTS; FLAX; FEEDING STUFFS**.

OIL CITY. A city in Venango County, Pa., 132 miles north by east of Pittsburg; on the Allegheny River, at the mouth of Oil Creek, and on the Erie, the Pennsylvania, and the Lake Shore and Michigan Southern railroads (Map: Pennsylvania, B 2). There are several bridges within the municipal limits, and Smithman's and Hasson's parks. The more prominent structures include the Carnegie Free Library, city hospital, high school, the Oil Exchange, and the office buildings of the Standard Oil Company. Oil City is the centre of the celebrated petroleum fields of western Pennsylvania, and has large refineries and barrel works; also foundries and machine shops, tubing and casing works, boiler and engine shops, and manufactories of oil-well supplies. Under a charter of 1889, the government is vested in a mayor, elected every three years, a bicameral council, and administrative officers, most of whom are elected by the council or confirmed by that body on nomination of the mayor. The treasurer, comptroller, assessors, constables, and school board, however, are chosen by popular vote. The water-works are owned by the municipality. Oil City was settled about 1825, but did not become of any particular im-

portance until after 1859, when the vast oil wells were developed. It was incorporated as a borough in 1863 and in 1874 it received a city charter. On June 5, 1892, a quantity of burning oil swept down Oil Creek from Titusville, 18 miles above Oil City, and caused the loss of over 100 lives and of property valued at more than \$1,000,000. Population, in 1890, 10,932; in 1900, 13,264.

OILCLOTH. A coarse canvas, coated on both sides, and partly saturated with thick oil-paint, one side having usually a colored pattern printed upon it in oil-paint. The canvas basis for oilcloth is usually jute or burlap. This is first sized by drawing through troughs filled with liquid glue, rye flour, tapioca, or varnish, different manufacturers employing different materials. As the canvas passes through the trough the surplus sizing is squeezed out by rollers between which it passes. In making the very wide varieties, the canvas is put upon a frame first and the sizing applied with a brush. After the cloth is sized it is rubbed down thoroughly with pumice-stone, either by hand or with steam rollers. The cloth then receives a coat of paint, composed of ochre, benzine, and

linseed oil. The surface is afterwards evened down by passing the cloth through a series of metal blades, which scrape off the superfluous paint. The surface is again rubbed down with pumice-stone and the process of painting and rubbing down is repeated many times, the number determining the quality of the cloth. The next step is the applying of the pattern. The pattern is carved on wooden blocks, a separate block for each color. The blocks are of pine, faced with a thin layer of harder wood, which is glued on. The part of the design assigned to each block is carved in relief upon it. The color is applied by rollers, which have taken up the coloring matter from troughs. The printing of the cloth is done by machinery. The cloth passes over a table and under the blocks, which have a rising and falling motion. The cloth is now passed to the drying-room, where the process of drying is hastened by artificial heat. When dry and hard the cloth is varnished, trimmed, and rolled. Manufacturers sometimes use instead of the carved blocks, pin blocks, which consist of three layers of wood firmly cemented together. The surface block is divided up into a series of pegs and interstices by sawing the block in lines very close together and at right angles to each other. All the pegs not needed for outlining the

figure are then cut away. See *History and Manufacture of Floor Covering* (New York, 1899).

OIL-FISH, or **GOLOMYNKA**. A remarkable fish (*Comephorus Baikalsis*) of the blenny family, living only in Lake Baikal (q.v.). It is about a foot long, is destitute of scales, and is very soft, its whole substance abounding in oil, which is obtained from it by pressure. It is never eaten. In winter it retires to great depths, but in summer approaches the shores, and great numbers often are stranded.

OILLET (OF., eyelet), or **CEILLET**. A small opening or window, often circular, used in mediaeval buildings; also called *œil de bœuf*.

OIL PALM (*Elæis*). A genus of palms of the same tribe with the coconut palm. The best known species, *Elæis guineensis*, sometimes attains a height of 20 to 30 feet, has pinnate leaves with spiny footstalks and flowers with an odor like anise or chervil. The fruit forms an immense head, like a great pineapple, consisting of a large number of bright orange-colored thin-skinned drupes, with hard stones and oily pulps, which by bruising and boiling yield a bland violet-smelling oil which when taken to cold climates becomes butter-like in consistency. This oil, now largely exported from tropical Africa, is much used for making candles, toilet soaps, etc., but when fresh is eaten like butter. The nut was formerly rejected as useless after the oil had been obtained from the fruit; but from its kernel a fixed clear and limpid oil called palm-nut oil is extracted and has become to some extent an article of commerce.

OIL RIVERS. A name applied to the channels forming the delta of the Niger (q.v.) in West Africa and the neighboring small independent rivers, on account of the vast forests of oil palms which line their banks (Map: Africa, E 4). The surrounding district, a British dependency, was formerly known as the Oil Rivers Protectorate, but is now a part of Southern Nigeria.

OILS (OF. *huile*, *ole*, *uile*, Fr. *huile*, from Lat. *oleum*, oil, from Gk. *ἐλαιον*, *elaion*, oil, olive oil, from *ἐλαία*, *elaia*, olive tree). A term applied to a large number of liquids characterized by being insoluble in water and being highly viscous. Their 'greasy feeling' often mentioned as an additional characteristic is due largely to their viscosity and insolubility in water. Capability of saponification (see further below), formerly considered essential, is confined to a variety of substances, chiefly of animal or vegetable origin, while the unsaponifiable class includes the so-called mineral oils and similar products prepared artificially. Chemically the oils possess no property in common which would justify their being grouped together in any rational classification of substances. And if they are still referred to collectively as a distinct class of chemical substances, it is owing partly to custom, partly to the fact that chemically different oils are sometimes associated industrially.

LIQUID FATS. The vegetable and animal oils of liquid fats do not differ essentially from the class of substances described under **FATS**. They, too, contain olein, palmitin, and stearin, together with certain other fatty bodies, which give each oil its characteristic properties. Palmitin and stearin are solids at ordinary tempera-

ture, but are freely soluble in the liquid olein, and a liquid fat is essentially a solution in one proportion or another of palmitin and stearin in olein. Olive, cottonseed, corn, linseed, and lard oils are types of this class of oils, all of which are soluble in ether, carbon disulphide, chloroform, hydrocarbons, etc.

All of the fatty oils are also capable of being saponified, i.e. of being broken up into glycerin and so-called fatty acids. The term 'saponification' (from Lat. *sapo*, soap) is used on account of the decomposition being oftenest effected by the use of caustic soda or potash, which combines with the freed fatty acids to form the mixtures of salts well known as soaps. There are, however, other methods by which the decomposition may be sometimes brought about. And since, whatever the method, the decomposition is accompanied by the chemical absorption of the elements of water, it is more exactly referred to, not as saponification, but as *hydrolysis*, or *hydrolytic splitting*. The several methods by which the hydrolysis of oils may be brought about include: (1) Boiling with caustic alkali; (2) the action of steam under high pressure; (3) bacterial action, e.g. when fats become rancid; (4) the action of dry heat.

The following classification of these compounds by A. H. Allen will be found useful; it serves to illustrate the origin and approximate composition of the more common oils.

Olive Oil Group, vegetable oleins, non-volatile, high viscosity, non-drying, insoluble in alcohol.

Rape Oil Group, derived from the Cruciferae, non-volatile, highest viscosity, non-drying, insoluble in alcohol.

Cottonseed Oil Group, non-volatile, medium viscosity, semi-drying, insoluble in alcohol.

Linseed Oil Group, drying oils, non-volatile, absorb oxygen, insoluble in alcohol, low viscosity.

Castor Oil Group, distinctly different from the above in chemical composition by reason of containing a large proportion of hydroxy-fatty acids including ricinoleic acid—highest viscosity, soluble in alcohol and glacial acetic acid, non-volatile, non-drying.

Lard Oil Group, animal oleins, non-volatile, non-drying, high viscosity.

Whale Oil Group, marine animal oils, slightly volatile, low viscosity, partly drying, darken with chlorine, characteristic odor.

Palm and coconut oils are omitted because solid at ordinary temperatures. Sperm oil is not a true oil, but a liquid wax.

Plants contain a greater variety and, as a rule, relatively larger quantities of oils than animals. Vegetable oils are obtained by the simple process of grinding or crushing and hydraulic pressing of seeds or kernels, which contain the largest proportion of oil. At times the ground materials are pressed cold and hot, the cold process yielding better products, but smaller quantities. Of late years extraction processes using light hydrocarbon solvents are much used. The solvents are allowed to act on the crushed material at a slightly elevated temperature; on exhaustion, the liquid is drawn off, and the solvent is separated by distillation. Oils produced by this process are very free from foets or gelatinous material, but, on the other hand, are liable to be contaminated with resins and coloring matters or any other material soluble in

the solvent used. Animal oils occur in cells of putrescible tissue and require prompt rendering or extraction to retain their quality. Rendering may be of three types, viz.: (1) Open-kettle rendering; (2) acid rendering; (3) steam rendering. In the first process the fatty tissue is chopped, heated over water until the oil or fat is melted, and tried out. The broken tissue shrivels and rises to the top, where it is skimmed off and pressed to remove traces of oil. On cooling, the oil and water stratify, and may be readily separated. In acid rendering, the fatty tissue is, without previous treatment, boiled with water and sulphuric acid, which dissolves away the tissue and liberates the oil. In steam rendering the tissue is destroyed by treatment with steam under pressure in autoclaves, the exhaust of foul-smelling gases being discharged into a chimney.

The drying oils, linseed, poppy-seed, etc., expressed by hot pressure, are subsequently boiled or heated with various oxidizing substances, such as the oxides of lead and manganese, in order to increase their drying or varnish-making properties. On mixing these boiled oils, which always contain some free fatty acid, with pigments whose base is some readily decomposable lead compound, such as white lead (basic carbonate), a lead soap forms and dissolves in the excess of oil. The resulting product, on exposure for some time to the atmosphere, readily dries or forms a tough elastic coating, which acts as a protective covering to the material beneath. Oils of the rape oil group absorb oxygen when heated, especially if air is forced through the liquid. Such are the so-called 'blown oils.' During this process the liquid becomes thicker, its viscosity and hence the lubricating value increasing materially. The thickness is probably caused by exchange of the sulphur contained by these oils for oxygen.

The tests usually applied to fatty oils include determinations of specific gravity, of the amount of alkali necessary for saponification, of the amount of free fatty acids present, of the amount of volatile fatty acids, and of the amount of bromine or iodine that the oil is capable of absorbing, as well as various color tests with acids and special reagents.

ESSENTIAL OR VOLATILE OILS. These are liquids which give the peculiar odor to plants. Their composition differs very widely. The various types are as follows: Terpenes, or hydrocarbons of the general formula $(C_{10}H_{16})_n$; certain ethers, aldehydes, ketones, and phenols (substances composed of carbon, hydrogen, and oxygen); and finally, certain substances containing sulphur or nitrogen among their elements, e.g. mustard oil. All these substances are soluble in alcohol, ether, petroleum, and certain other organic solvents. Some of them have been prepared synthetically, but the greater number are still obtained from plants, by one of the following processes: (1) By distilling the plant with water; (2) by extraction of the plant with solvents; (3) by pressing the plant; (4) by macerating in fat; (5) by enfleurage, or absorption in fat. In the distillation process, the material is put into a still with a large quantity of water. During ebullition, the steam carries the oil over mechanically and separation of oil and water takes place on cooling, the oil being usually on top. Turpentine is produced by this process from the gum of the pine tree, the residue in the retort

being common rosin. The processes of extraction and expression require no explanation. Maceration, employed in those cases in which the product would be injured by high temperatures, consists in gently heating the flowers or leaves in pure sweet tallow or lard, until exhausted, the product being called a pomade. The oil may be extracted from it with alcohol. Enfleurage is used in those cases in which an elevation of temperature would destroy the odor. The flowers or leaves are placed on glass-bottomed trays coated with pure tallow or lard; these trays are then stacked up and allowed to stand until the fatty matter becomes strongly charged with the perfume, and this is subsequently extracted with cold alcohol.

HYDROCARBON OILS. An account of the chemistry of the hydrocarbons may be found in a special article under the name. Mixtures of liquid hydrocarbons, or 'hydrocarbon oils,' of natural or artificial origin, are used largely as fuels, illuminants, and lubricants. The main sources of these oils are petroleum, shale, and bituminous coal. Most of the native American oil comes from the Devonian and Upper Silurian. It occurs in sandstone or conglomerate (oil sand) between impervious layers of shale or slate. The Russian petroleum deposits are usually of Tertiary origin. Considerable discussion has arisen concerning the origin of petroleum. According to Berthelot it is produced by the action of steam and carbonic acid gas on alkali metals. Mendeléeff regards it as the product of the action of water on metallic carbides. According to other theories, petroleum is derived from either plant or animal matter by a slow process of destructive distillation under the enormous pressure of superincumbent strata. Since either natural gas or anthracite coal is usually found at no great distance from oil sources, it would seem that the last mentioned theories are the most plausible. American petroleum is mainly composed of the liquid members of the marsh gas or paraffin series together with small quantities of olefins, and traces of benzenes. Russian oils consist largely of the naphthene series, similar to the olefins. Oil fresh from the well is a thick, syrupy liquid, greenish brown to black in color and of a disagreeable odor. Many samples are fluorescent. The specific gravity varies from 0.782 to 0.85. Marsh gas, ethane, propane, and butane are generally found in the fresh oil, but soon escape. Sand and water are frequently mixed with the oil, but are readily removed by settling in tanks.

The oil is prepared for the market by a process of fractional distillation and refining of the fractions with acid and alkali. The distillation process serves to separate the oil into three portions, viz.: (1) Benzine distillate; (2) burning oils; (3) residuum. The first portion is redistilled and yields very volatile products (naphthas and gasolenes) that are used as solvents and for power in small engines. The second portion is likewise redistilled and yields two fractions, which are treated separately with strong sulphuric acid, followed by a washing with water, then treatment with caustic soda, and a final washing with water. By this process the oils are bleached and partly deodorized. The two oils are commonly known under the name of kerosene. If the distillation of the crude oil has been carried on by the vacuum process, in

which the heavy vapors are withdrawn from the stills as soon as formed, 'cracking' does not take place and the residuum may be used entirely for preparing lubricating oils and vaseline. During the 'cracking,' which is facilitated by heating the stills over free fires, the residuum is decomposed and yields a further series of volatile products (chiefly used as burning oils), together with paraffin, lubricating oil, yellow 'wax,' and coke. Russian oils may be successfully treated by a continuous process of distillation, as they are not very susceptible to cracking. To guard against any possibility of change, the stills are heated by superheated steam. Oils containing large quantities of sulphur are very offensive and must be distilled over mixtures of oxides of copper and lead to take up the sulphur, before they can be refined. The crude oil is, however, now largely used for fuel purposes with steam or compressed air in injector burners. The following mineral oils are commercial articles:

Petroleum Ether, distills over between 40° and 70° C (104° and 158° F.), and is used as a solvent and for gas machines.

Gasolene, distills over between 70° and 90° C. (158° and 194° F.), and is used as a solvent and for carbureting coal-gas.

Naphtha, distills over between 80° and 110° C. (176° and 230° F.), and is used for burning in vapor stoves, and as a solvent for resins.

Benzine, distills over between 120° and 150° C. (248° and 302° F.), and is used as a substitute for turpentine for cleaning clothing.

Kerosene. See article PETROLEUM.

Lubricating Oils, including spindle oils and cylinder oils. The analytical tests applied to these oils include determinations of specific gravity, the 'fire test' (i.e. determination of the flash-point and burning-point), the cold test, and determinations of viscosity and neutrality. For burning oils the fire test and the determination of neutrality are the most important. For lubricating oils the determination of viscosity is also essential. A large number of forms of apparatus have been devised for obtaining the flash and burning point, but no other is as simple and reliable as the New York State 'closed tester.' This apparatus consists of a double boiler of copper heated by a gas or lamp flame, the inner chamber being filled with oil and covered with a glass plate perforated with two holes, one for the thermometer, the other for the introduction of the test flame. The oil must not be heated more rapidly or slowly than 2° F. per minute. At minute intervals the test flame is brought to the hole in the glass cover. A flash is said to occur when a blue flame momentarily plays over the surface of the heated oil, and at this point the thermometer is read. The burning-point, usually a few degrees higher, is that temperature at which the oil begins to burn.

Previous to the introduction of petroleum products, bituminous shale had been subjected to destructive distillation, yielding gas, ammonia, oil, and tar. This process is still carried out in Scotland, Germany, and various other European countries. Oil does not occur as such in bituminous shale, but is liberated by the decomposition of the latter, which is a sort of pitch. Shale, in small pieces, is fed into vertical retorts heated to a low red heat, and steam is injected into the retorts to promote distillation. The vapors are condensed in a hydraulic main and scrubbers

similar to those employed in the distillation of coal (see GAS, ILLUMINATING), the gases given off being utilized for heating the retorts. The crude oils are refined with acid and alkali, and are redistilled to furnish naphthas, burning and lubricating oils, and paraffin (q.v.).

OIL SAND. A term applied to beds of sand or porous sand rock which contain petroleum. There may sometimes be several oil sands separated by beds of rock in one formation. See PETROLEUM.

OIL SHARK, or SOUP-FIN SHARK. A tope-like shark of southern California (*Galeorhinus zyopterus*), often six feet long and grayish in color, with the front of both dorsal fins black. It is sought for the oil in its liver—single fishes sometimes yielding a gallon—and for the fins, which are highly prized by the Chinese as material for soup. The fins are dried and a fine white gelatin is extracted. The fish is rarely taken except in July and August, when it enters quiet bays to be delivered of its young.

OIL-STONE. A very smooth fine-grained type of rock used for abrasive purposes, more especially for sharpening various cutting instruments. The material used in the manufacture of oil-stones is obtained from a number of different localities, but the most important stones at the present time are those from Arkansas, Indiana, and Germany. Those from Arkansas go under the name of *Arkansas* and *Washita* stones and are an extremely fine-grained siliceous rock of white color. They are especially adapted to sharpening fine tools requiring smooth edges. Owing to the limited supply of the Arkansas rock of good quality, the difficulty in quarrying, and the very large loss in trimming, the material retails at \$2.50 per pound. The Washita is less expensive. The German stone is much used for razor hones. The Indiana oil-stones, which are very fine-grained sandstones, are commonly known in the market as *Hindustan* or *Orange* stones. They are not suited for sharpening such fine steel instruments as those for which Washita rock is used. See ABRASIVES.

OIL WELLS. See PETROLEUM.

OINTMENT (ME. oinment, from OF. oignement, from oigner, oindre, ongie, to anoint, from Lat. ungere, ungere, Skt. añj, to smear). A fatty preparation, either soft or solid at ordinary temperatures, but liquid when rubbed into the skin. Ointments are composed of a fatty base, either lard or vaseline, alone or mixed with olive or almond oils or with spermaceti or wax, to diminish or increase their consistency as desired. Benzoin is often added to the lard or other base to prevent decomposition. Hydrated sheep's wool fat (lanolin) is more quickly absorbed than most fats and may be mixed with more than twice its weight of water without

losing its ointment-like character. It is employed as a base when rapid absorption is wished, as sometimes happens in the case of mercury. Into the base is thoroughly incorporated the substance which, as a rule, gives to the ointment its remedial virtues. The greatest care is necessary to insure a minute subdivision of the medicinal element in order that the ointment may be homogeneous and free from gritty particles. The United States Pharmacopoeia recognizes twenty-seven ointments, but many more are made. Among the better known may be mentioned zinc, sulphur, and the various mercurial ointments. **COLD CREAM** (q.v.) is the popular name of rose-water ointment.

OISE, wáz. A northern department of France, formed from parts of the former provinces of Ile-de-France and Picardie, and lying on both sides of the Oise River, north of Paris (Map: France, J 2). Its area is 2272 square miles. The surface is generally level and about two-thirds of it is cultivated, producing cereals, potatoes, sugar-beets, and large quantities of fruit, including grapes. Stock-raising is well developed, as are the industries, covering the manufacture of iron, pottery, paper, chemicals, and textiles. Population, in 1891, 401,835; in 1901, 407,808.

OISE. A river of Northern France. It rises among the Ardennes in Southern Belgium, flows southwest through the French departments of Nord, Aisne, Oise, and Seine-et-Oise, and joins the Seine 15 miles northwest of Paris (Map: France, J 2). Its length is 189 miles, and it is navigable 86 miles to Chauny. A lateral canal follows part of its upper course, and other canals connect it with the Somme, the Sambre, and the Scheldt rivers. The principal towns on its banks are Compiègne, Chauny, and Novon.

OJEDA, O-HA'DÁ, ALONSO DE (1465-1515). A Spanish explorer, born of noble parentage, in Cuenca, Spain. He accompanied Columbus on his second voyage, and from that time until his death was closely associated with the exploration and settlement of the newly discovered region. One of his first exploits was the capture by stratagem, in 1495, of the cacique Caonabo, who had formed a scheme for an alliance of all the natives against the Spaniards in Hispaniola. Four years later, accompanied by Columbus's former pilot, Juan de la Cosa, and by Americus Vesputius, he succeeded in exploring the northern coast of South America from some point on the north coast of what we now call Brazil as far westward as the Gulf of Maracaibo. He made a second voyage in 1502, and for trespassing on territory given by the Papal bull to Portugal, was upon his return censured and heavily fined. In 1509, with about 300 men, he sailed from Hispaniola to take possession, as Governor, of Nueva Andalucía, which comprised the territory between the gulfs of Urabá (Darien) and Maracaibo. Near the site of the present town of Cartagena he landed with a party of about seventy men in order to capture Indians for slaves, but the party was overpowered, and only Ojeda and one other man escaped. A colony was then established at San Sebastian, but provisions soon ran so low that Ojeda set out for Hispaniola for supplies and reinforcements. The vessel was wrecked off the coast of Cuba, and Ojeda reached his destination only after great hardships. He was unable to fit

out another expedition, and died in great poverty and misery at Santo Domingo.

OJIB'WA, or **CHIPPEWA**. The largest and most important tribe of the Algonquian stock (q.v.), formerly holding an extensive territory about the upper Great Lakes, in Michigan, Minnesota, Ontario, Manitoba, and adjacent regions, and now gathered upon a number of reservations within the same area. The name is from a root signifying 'puckered,' or 'drawn up,' said by some authorities to refer to the peculiar sewing of the tribal moccasin, although this derivation is disputed. They call themselves usually *Anishinabeg*, 'spontaneous men,' were known to the French as *Ojibois*, or *Saulteurs*, from their residence about Sault Saint Marie, and were commonly known to the English as *Ojibwa*, or in its corrupted form, *Chippewa*.

Although the Ojibwa are the largest tribe north of Mexico, yet, owing to their looseness of organization and remoteness from the settlement frontier, they were not proportionately conspicuous during the colonial period. According to their tradition they emigrated from the Saint Lawrence region in the east, in company with the Ottawa and Potawatami, the three tribes separating at Mackinaw, the two others going southward, while the Ojibwa spread westward along both shores of Lake Superior. The Cree, Maskegon, and Missisaga (qq.v.) are claimed by the Ojibwa as later offshoots from their own tribe, and are sometimes so closely affiliated that they are hardly distinguished from the Ojibwa. The Ojibwa, Ottawa, and Potawatami, though differing in language, also formed a sort of loose confederacy, and were sometimes for this reason designated in Indian councils as the 'Three Fires.' When first known, about the year 1650, the Ojibwa were confined to a comparatively narrow area close along the shore of Lake Superior, hemmed in by the hostile Sioux and Foxes on the west and south. On procuring firearms from the traders, however, they became aggressive and soon drove out the Foxes from northern Wisconsin, compelling them to take refuge with the Sauk farther south. They then turned their attention to the Sioux, driving them from the headwaters of the Mississippi and continuing their victorious westward march until they had occupied the upper Red River country and established their frontier band in the Turtle Mountains, on the boundary between Dakota and Manitoba. In the meantime other bands of the tribe had overrun the Ontario peninsula, formerly conquered by the Iroquois from the Huron and others. These bands later became known as Missisaga. The Ojibwa first turned the westward tide of Iroquois invasion by inflicting upon them a disastrous defeat at the place thereafter known to the Indians as 'The Place of Iroquois Bones,' now Point Iroquois, near Sault Sainte Marie. Throughout the colonial wars they adhered to the French side and later to Pontiac, but took sides with the English and Tecumseh against the Americans in the Revolution and War of 1812, joining with other tribes in the general treaty of peace in 1815. Since then they have been at peace with the whites. By a general treaty of 1825 for the adjustment of intertribal boundaries in the Northwest the Government made an end to the hereditary war between the Ojibwa and the Sioux. By other treaties, on both sides of the

line, they have sold the greater part of their former territory, retaining only their present reservations.

Scattered over such an immense region, extending hundreds of miles from east to west, the Ojibwa had a large number of bands and divisions, some of which were hardly known to the others more remote, as well as a large number of clans which were not all represented in the same section. According to Warren, they themselves recognized ten principal divisions, including three on the Canadian side of the boundary. Among these the Makandew, or Pillagers, about Leech Lake, Minn., are perhaps the best known. The number of clans is variously stated from eleven to twenty-three, Warren making it twenty-one, grouped into five phratries representing original clans, one of which claimed the hereditary chieftainship, while another claimed precedence in the war councils. In their general habit they resembled the other northern Algonquian tribes. Living in a cold country, they gave little or no attention to agriculture, but depended for subsistence upon hunting, fishing, and the gathering of wild fruits and seeds, particularly the abundant wild rice of the lake region, with the sugar which they had learned to extract from the maple. Their houses were framed in wigwam or tipi shape, covered usually with birch bark, from which also they made their light canoes, their bowls and boxes, and upon which they scratched their simple pictograph records. They made no pottery, but were skillful mat-weavers. They had an elaborate mythology and ritual, chiefly in the keeping of the secret Mide Society. Despite missionary effort and contact with civilization, the primitive culture of the Ojibwa is little modified. The principal works in the Ojibwa language are Baraga's Dictionary, Belcourt's Grammar, and the shorter treatises of Schoolcraft. Of myths, the best collection is Schoolcraft, *Algie Researches*, upon which Longfellow based his *Hiauatha*. In ritual mythology and general description the best work is Hoffman, "Midewiwin of the Ojibwa," in *Seventh Report of the Bureau of Ethnology*. On traditional and later history the most satisfactory is Warren, "History of the Ojibwa," in fifth volume of Minnesota Historical Society Collections, after which come Copway, *History of the Ojibway Indians*, and Jones, *History of the Ojibway Indians*, all three authors being of mixed Ojibwa blood. In special research may be noted Jenk, "Wild Rice Gatherers," in *Nineteenth Report of the Bureau of Ethnology*.

The Ojibwas were estimated in 1764 at about 25,000; in 1783, at 15,000; in 1843, at 30,000; in 1851, at 28,000. They number now about 30,000, divided between the United States and Canada as follows: United States—Minnesota (chiefly at Leech Lake, Red Lake, and White Earth), 8130; Wisconsin (chiefly at Lac Court Oreille, Lac de Flambeau, and La Pointe), 5100; North Dakota (Turtle Mountain), 2460; Michigan, 700 on upper peninsula, with 5600 scattered Chippewa and Ottawa on lower peninsula; Kansas, mixed Munsee and Chippewa, 90. Canada—all in Ontario Province, on numerous small reservations, and variously designated as 'Chippewas,' 'Ojibbewas,' and 'Saulteaux,' 10,760, besides Ojibbewas and Ottawas of Manitoulin and Cockburn islands, 1950. See Colored Plate of INDIANS, AMERICAN.

O. K. The story that General Jackson used these letters to indorse official papers as correct seems to have been started by Seba Smith (Major Downing), the humorist. It was a hit at Jackson's supposed illiteracy, and as a party cry during the Presidential campaign of 1832 acquired great vogue. Parton states that Jackson used to indorse legal documents O. R., order recorded, and the mistaking of the letters was probably the basis of Downing's jest. The term is also said to have originated with Josh Billings and has been ascribed to several other persons. Jacob Astor is said to have used it to indicate the standing of traders about whom he was questioned. In colonial days, the best tobacco and rum were imported from Aux Cayes, and from this fact Aux Cayes (ô kâ) became a popular expression for excellence.

OKA, ô-kâ'. A river of Central Russia, and the principal west affluent of the Volga (Map: Russia, F 3). It rises on the southern boundary of the Government of Orel and flows in a generally northeast direction with several large bends, joining the Volga at Nizhni-Novgorod after a course of 960 miles through the most fertile parts of Russia. The river is navigable for steamers to the town of Bielev, a distance of 862 miles, and for smaller vessels 32 miles farther to the city of Orel. It is a very important commercial route.

O'KA. A mission settlement of Catholic Iroquois, Nipissing, and Algonquin, on the Lake of Two Mountains, a few miles from Montreal, in Quebec Province, Canada. Oka is the Algonquin name, said to signify a pickerel, while the Iroquois name, Canasadaga, by which it was formerly known, refers to the position of the village on the slope of a hill. It was settled originally in 1720 by the Catholic Iroquois who had previously been at the Sault au Recollet and who numbered about 900 at the time of removal. They were soon afterwards joined by some Nipissing and Algonquin from the abandoned mission of Isle aux Tourtes. The two bodies occupy different parts of the same village, separated by the church, the Iroquois using the Mohawk language while the others speak Algonquin. In 1881 a part removed to Gilson, Ontario, where they are now established. Those at Oka number now about 450.

OKAPI, ô-kâ'pé (African name). An animal of the giraffe family (*Ocapia Johnstoni*), discovered in 1899 by Sir Harry Johnston in the Semliki Forest of the Congo State. The animal stands about 4½ feet high at the withers, and is of the peculiar form shown on the Plate of GIRAFFE AND OKAPI. The head is giraffe-like, but there are no external horns. The tail is rather short, and the neck is short and thick. The skull is characteristically giraffine and exhibits rudiments, or rather vestiges, of three horn-cores. The coloration as described by Sir Harry is extraordinary. The cheeks and jaws are yellowish white, contrasting with the dark-colored neck. The forehead and a line down to the muzzle is a deep-red chestnut, and the large broad ears are of the same tint, fringed with black. The neck, shoulders, and body range in tone from sepia and jet-black to vinous red; the belly is blackish, the tail chestnut with a small black tuft. The hind quarters and hind and fore legs are either snowy white or pale cream color, touched here and there with orange, and boldly

marked with purple-black horizontal stripes and blotches. Not much is known of the okapis except that they live in pairs in the forests of the northern Congo Basin. Consult *Transactions and Proceedings of the Zoölogical Society of London* for 1901 and 1902.

OKAVANGO, ô'ká-vā'gô. A river of Central Africa. See KUBANGO.

OKAYAMA, ô'ká-yā'má. The capital of the prefecture of the same name and of the Province of Bizen, Japan, situated on the river Asahi, in the southwestern part of Hondo, 89 miles by rail west of Kobe (Map: Japan, C 6). It has an old castle formerly inhabited by the daimio, and close to it a magnificent Japanese garden. Population, in 1898, 58,025.

OKEECHOBEE, ô'ké-chô'bé. A lake in the southern part of Florida, the largest in the Southern United States (Map: Florida, H 5). It is 40 miles long and 30 miles wide, with an area of 1250 square miles and a maximum depth of 12 feet. It borders on the great Everglade swamps, and its shores are nearly everywhere inaccessible, consisting of marshy jungles, while great parts of the lake itself are overgrown with weeds. Its waters are discharged partly by seeping through the Everglades, partly through the Caloosa River, connection with which has been facilitated by several canals which have reduced the size and depth of the lake, and drained large portions of the surrounding swamps, rendering them fit for agriculture.

O'KEEFE, ô'kéf', JOHN (1747-1833). An Irish playwright and actor. He was born in Dublin, and in his youth studied painting, but he began writing comedies at the age of fifteen. A few years later he joined a theatrical company in his native city, and wrote meanwhile a number of small pieces, in which he appeared at his own benefits. His *Tony Lumpkin in Town* was produced at the Haymarket, London, in 1778, and gained for its author an English reputation. He settled in London, and, though threatened with blindness, continued to write for the stage. His dramatic pieces by his own statement number sixty-eight, of which about fifty were performed, and some of them, such as the operatic farces, *The Highland Reel* and *The Agreeable Surprise*, and the farce *Wild Oats*, were unusually successful. In 1798, when he had become almost totally blind, he published *The Dramatic Works of John O'Keefe, Esq.*, in four volumes. For some years afterwards he was in straitened circumstances, till he was relieved by a pension from the Crown. In 1830 he went to live in Southampton, where he died on February 4, 1833. The next year, his daughter Adelaide, who was herself an author, published a collection of his verse under the title of *A Father's Legacy to His Daughter*. O'Keefe's plays, many of which have been separately published, are deficient in characterization and incident, and rough in diction, but full of broad humor and rollicking spirits. Consult the *Recollections of the Life of John O'Keefe* written by himself (London, 1826); also as edited by R. H. Stoddard (New York, 1876); Geneste, *History of the English Stage* (Bath, 1832).

O'KEFINO'KEE SWAMP. One of the largest swamps in the United States, covering parts of Baker County, Fla., and of Ware, Clinch, and

Charlton counties, in Georgia (Map: Georgia, D 5). It consists of a series of swamps about 180 miles in circuit, and having an area of 500,000 acres. It is filled with pools and islands, some overgrown with bay trees, others with vines and brush. Moccasins and alligators are numerous. In the eastern portion is an open lake dotted with small floating islands.

OKEGHEM, ô'ke-gēm, **OKEKEM**, **OKEGHEM**, **OCKENHEIM** (c.1420-c.1500). One of the great masters of the Netherlandish school of composition. He was born in East Flanders and was a chorister in the Antwerp Cathedral, and subsequently studied under Dufay. Accuracy with regard to dates considering the life and history of Okeghem is impossible. He was first master of music to the French King Charles VII. (1454), and held similar important appointments under Louis XI. As a teacher he is principally famous through his pupil Depres (q.v.), who introduced his master's style and music to the world at large, and greatly influenced modern German church music through Luther, who was a contemporary and admirer of Depres. Okeghem's music is still very much admired by musical scholars. He wrote nearly twenty masses, besides numerous motets, a ninefold canon in 36 parts, chansons, etc. See MUSIC—SCHOOLS OF COMPOSITION (section iii.).

O'KELLY, CHARLES (1821-95). An Irish historian, born in Screen Castle, Galway, and educated at the Irish College in Saint Omer, France. He took part in the Civil War in 1842, and when Cromwell won, O'Kelly with 2000 compatriots followed the fortunes of Charles II. in France and Spain. They returned to England at the Restoration, and after the next revolution O'Kelly represented Roscommon in 1689 at the Dublin Parliament of James II., whom he also served as colonel of cavalry. He defended the island of Boin against the Orange troops in 1691, but was forced to capitulate there, as well as from his later post, and he retired into private life at the Treaty of Limerick. His *Macaria Excidium* (1692), an invaluable contemporary account of the revolution, was first printed by the Camden Society in 1841, and J. C. O'Callaghan (q.v.) prepared an annotated edition of it for the Irish Archaeological Society in 1850, while a third appeared under the title *The Jacobite War in Ireland* (1894).

O'KELLY, JAMES (c.1757-1826). A pioneer preacher of the Methodist Episcopal Church and leader of the first secession from it. He was born in Ireland about 1757, came to America, and in 1778 began work as a traveling preacher. He was among the number who were ordained elders at the organization of the Methodist Episcopal Church in 1784. He became presiding elder of the South Virginia district, and was a member of the first Council meeting in 1789. He took the lead in a movement opposing the authority and life tenure of the bishops. O'Kelly shortly after the General Conference of 1792 withdrew from the connection, taking several other ministers with their congregations or parts of congregations with him, and formed a Church known as the Republican Methodist. His opposition to Methodism became more bitter, and he denounced ordination as spurious. His secession movement reached its height in 1795, causing a loss of nearly 6500 members to the Methodist

Church. The name of his organization was afterwards changed to the Christian Church, but at the end of twenty years it had almost disappeared. Consult Buckley, *History of Methodism in the United States* (New York, 1897).

OKEN, òk'en, LORENZ (1779-1859). A German naturalist and philosopher, born at Bohlbach. His real name was Ockenfuss. He studied medicine and the natural sciences at Würzburg and Göttingen. In 1807 he became a professor of medicine at Jena, and in 1812 received the chair of natural sciences, but in 1819 he was compelled to resign his position because a scientific journal called *Isis*, which he had conducted since 1816, gave offense to the Government. In 1828 he obtained a professorship in the newly founded University of Munich, and in 1832 accepted a chair at Zurich, where he remained until his death. Oken sought to unify all the natural sciences, and invented an entirely new and very complicated terminology for the purpose. His system was in some respects fantastic, and is now almost obsolete. Some of his speculations were, however, fortunate. As early as 1805 he foreshadowed the theories of the cellular structure of organisms and of the protoplasmic basis of life, and his vertebral theory of the structure of the skull, although false, was an important contribution to comparative morphology. His most important works are: *Die Zeugung* (1805); *Ueber die Bedeutung der Schädelknochen* (1806); *Lehrbuch der Naturphilosophie* (1808-11), translated into English by Tulk and called *Elements of Physio-philosophy* (1847); *Lehrbuch der Naturgeschichte* (1813-27).

OKHOTSK, ò-kòtsk', SEA OF. A large inlet of the Pacific Ocean, indenting the east coast of Siberia, and separated from the ocean on the east by the Kamchatka Peninsula, and on the south by the Kurile Islands (Map: Asia, O 3). In the southwest it communicates with the Japan Sea by La Pérouse Strait between the islands of Yezo and Sakhalin, and by the long passage which separates Sakhalin from the mainland. It is nearly rectangular in shape, its northern shore lying nearly on the 60th parallel N., and it is about 1000 miles long and 600 miles wide. The coasts are steep and forbidding, very sparsely inhabited, and ice-bound from November to April and even to July. The open sea is ice-free, but subject to heavy fogs and storms. The sea is very little frequented, but has been exploited by American whalers for the last half century.

OKINAGAN, ò'kè-nā'gān. An important tribe of Salishan stock (q.v.), and formerly the head of a confederacy including also the Colville, Sanpoil, and a number of other cognate tribes. They occupied an extensive territory upon Okinagan and Similkameen rivers in northern Washington and the adjacent part of British Columbia. They were converted by Jesuit missionaries about fifty years ago, and are now civilized and fairly prosperous. They reside upon the Colville reservation in northern Washington, numbering altogether 575, and have been made citizens under the allotment act.

OKINAWA, ò'kè-nā'wā. A Japanese ken or prefecture formed in 1879 to include those islands of the Loo-Choo (q.v.) Archipelago that were not incorporated into Kagoshima Ken. It takes its name from Okinawa, the largest of the group.

OKLAHOMA, òk'la-hò'mā. A former Territory of the United States, lying in the south central division between 34° and 37° north latitude, and between 96° and 103° west longitude. It was bounded on the north by Colorado and Kansas, on the east by Indian Territory, on the south by the last and by Texas, and on the west by Texas and New Mexico. Its extreme north and south dimension was 205 miles, and its extreme length from east to west, including the long narrow western projection constituting Beaver County, was 383 miles. Its area was 38,848 square miles. In June, 1906, Congress authorized the admission of Oklahoma, together with Indian Territory (q.v.), as one State. Nevertheless, the character of the statistical material necessitates the treatment of each former territory separately.

TOPOGRAPHY. The surface is in general a rolling plain rising gradually from an elevation of about 800 feet in the extreme east to 2500 feet on the western boundary of the main portion, and to 5000 feet on the extreme western boundary of Beaver County. A range of hills known as the Chautauqua Mountains runs through the central portion. In the south the picturesque Wichita Mountains rise in a group of more or less isolated granite peaks to a height of 1000 feet above the surrounding plains. The western part of the Territory belongs to the region of the Great Plains rising toward the Rocky Mountains. The Red River flows on the southern boundary, and the southern part of the Territory is drained by its tributaries, chief of which are the North Fork and the Washita, the latter joining its main stream in Indian Territory. The rest of the Territory is drained by the Arkansas River, whose main stream flows through the northeastern corner. Several of its large tributaries traverse the Territory from west to east, namely, the Salt Fork, the Cimarron, and the Canadian River with its long North Fork.

CLIMATE AND VEGETATION. The climate of Oklahoma is very favorable for agriculture, since, owing to the southern situation, the winters are not severe, and the rainfall is for the most part sufficient. There is, nevertheless, a considerable range of temperature, and the region is subject to severe and sudden cold waves. The maximum temperature recorded during eight years is 115°, and the minimum 25° below zero. The latter figure is, however, entirely abnormal, and the cold winter periods are of short duration, the mean temperature for the coldest month (January) being well above freezing (36.9°). The mean temperature for July is 81.2°, and for the year 59.5°. The average annual rainfall is 31.8 inches, evenly distributed through the year with a maximum in midsummer, but ranging in localities from 57 inches to a small amount, the smallest amount falling in the extreme northwest. In the western part generally the precipitation is very light for farming. The soil is formed by the decomposition of the underlying rock formations, and consists chiefly of red clay and sandstone material. In the river valleys these are mixed with a rich black alluvium, and the soils are generally of sufficient depth to be of almost inexhaustible fertility.

There are some forests of oak, walnut, and hickory in the east, but the western plains are generally treeless, and covered with grama, drop-seed, and bunch grasses, while in the ex-

treme west are found sage-brush, yucca, and cactus. For Fauna, see paragraph under UNITED STATES.

GEOLOGY AND MINERAL RESOURCES. The surface rock in the greater part of the Territory is Triassic sandstone, on which here and there are small areas of Cretaceous deposits. The great central Carboniferous area of the United States covers the eastern part of the Territory, and the western part of Beaver County consists of Neocene deposits. The Wichita Mountains in the south present an intrusion of Archean rocks flanked by the upturned Silurian strata. The principal minerals found are building-stone, gypsum, salt, petroleum, iron, gold, and silver. The production of petroleum, begun in 1901, amounted in 1904 to 652,479 barrels.

AGRICULTURE. Oklahoma is preëminently an agricultural and stock-raising region. The development of agriculture since the Territory was opened to settlement has been extraordinary. In 1900, 15,719,258 acres, or 63.3 per cent. of the total area, was included in farms, of which 35.1 per cent. was improved. The average size of farms was 251.5 acres. Cash tenants represented 8.2 per cent. of the farms, and share tenants 12.9 per cent.

The striking feature is the great variety of crops successfully grown. The cotton yield per acre is in excess of that of any other State or Territory.

Corn and wheat lead in importance. In 1905 there were 1,902,948 acres of corn and 1,434,648 acres of wheat. Other cereal crops in 1905 were: oats, 294,442 acres, and barley, 14,920 acres. Hay and forage for the same year had an area of 305,070 acres, and potatoes an acreage of 10,935. Cotton is produced most extensively in the southern section. In 1905, 418,184 acres were devoted to this crop. The cultivation of Kafir corn, sorghum, melons, peanuts, castor beans, and broom corn receives considerable attention. Not a little fruit is grown. The peach trees in 1900 numbered 5,519,072, or over five-eighths of the total number of fruit trees. In 1905 there were 1,983,249 acres of vacant Government land in the Territory subject to homestead entry. A great part of this was in the arid Beaver County, formerly known as 'No Man's Land.' For the recent opening of land to settlement, see section *History*.

STOCK-RAISING. The western third of the Territory is given up to cattle-raising, which flourished before the region was opened to settlement. The number of cattle has increased prodigiously since. Horses, mules, and swine are also important, and some sheep are raised.

The following table gives the number of domestic animals on farms in 1900 and 1905:

	1900	1905
Dairy cows.....	165,852	192,332
Other cattle.....	1,543,900	1,387,151
Horses.....	303,631	411,772
Mules and asses.....	57,198	87,373
Sheep.....	48,535	57,240
Swine.....	584,878	595,612

MANUFACTURING. The census of 1900 showed 870 establishments, with 2054 wage-earners, and products valued at \$7,083,938. Of these 316 establishments, with 1294 wage-earners and prod-

ucts valued at \$5,504,869, were of the class of establishments included in the 1905 census, when there were reported 657 establishments, with 3199 wage-earners and \$16,549,656 in products. The chief industries were flour and grist-mills, cotton-ginning and the manufacture of cotton-seed oil and cake.

RAILROADS AND COMMERCE. The development of Oklahoma was not delayed for want of railroad facilities. The mileage increased from 899 miles in 1900 to 2790 miles in 1905. The principal lines were: Atchison, Topeka, and Santa Fe; Chicago, Rock Island and Pacific; Choctaw, Oklahoma and Gulf; Saint Louis and San Francisco. There are no navigable streams. Wheat is much the largest export. Cattle, corn, hogs, and cotton are other important exports. Coal and manufactured articles are imported.

BANKS. The rapid economic growth of the Territory is also seen in the development of its banking facilities. There were only three banks when Oklahoma was organized. In 1892 there were 9 banks; in 1895, 57; and in 1902, 206. The banks are governed by a stringent banking law, passed January, 1898. It prohibits private banking, created the office of bank commissioner, makes quarterly reports obligatory, defines the minimum of capital and the liability of the officers. The condition of the various banks in 1905 is shown in the following table:

	National	State
Number.....	98	257
Capital.....	\$3,780,000	\$2,491,200
Surplus.....	391,491	233,702
Cash, etc.....	431,178	845,516
Loans.....	10,559,780	6,238,088
Deposits.....	12,822,192	8,239,201

FINANCES. The budget grew during 1890-1904 from less than \$40,000 to more than \$1,000,000. A small public bonded debt was created in 1893 for purposes of construction, but besides this an excess of expenditure over receipts was a constant feature from 1890 to 1900. This resulted in an accumulation of \$684,176 of unpaid and interest-bearing warrants. However, there was December 1, 1904, a balance of \$669,810 in the treasury. The main sources of income are a general tax and the rentals of public lands. The receipts from the latter source go mainly for support of the various educational funds. For the biennium ending November 30, 1904, the total receipts were \$1,900,106; and the expenditures were \$1,878,736, out of which 75 per cent. was devoted to educational purposes.

POPULATION. From 1890 to 1900 Oklahoma was a prominent centre for native-born American colonists. The great fertility of the land was an irresistible attraction to home-seekers. The population increased from 61,834 in 1890 to 398,331 (excluding Indians—13,873) in 1900, or 544 per cent. Kansas, Missouri, and Texas have been the largest contributors to the population. Naturally the urban population is small, only 5 per cent. being in cities of over 8000. The federal estimate of population in 1905 was 558,261. Oklahoma City had a population of 10,037 in 1900 and 33,918 in 1905; Guthrie, 10,006 in 1900, and 20,000 (local est.) in 1905.

INDIANS. The opening of 505,000 acres of the

Kiowa and Comanche and Apache reservations between June 6 and December 6, 1906, left only small scattered tracts of Indian reservations. The Indians are slowly progressing, but in the main continue to live in idleness.

RELIGION. In 1900 there were about 900 church organizations, with a membership of 70,000. They owned church property valued at \$500,000. The Catholic Church had a membership of 13,804. The Methodist Episcopal, Christian, Baptist, and Missionary Baptist churches each recorded a membership of nearly 8000, but the total number of adherents was much greater. The Methodist Episcopal South had 6340 members.

EDUCATION. In 1900 the illiterate population amounted to 5.5 per cent. of the total population ten years of age and over. Almost from the first Oklahoma has provided facilities for primary education equal to those of the most advanced States. The first public structure in almost every community was a schoolhouse. Two sections in each township were reserved for the use and benefit of the common schools. The total receipts for public schools in 1904 were \$1,696,765, and the total expenditure was \$1,359,624. In 1904 there were 204,716 children between the ages of five and eighteen, of whom 151,071 were enrolled in the elementary schools and 1815 in the public high schools. In 1901 the Legislature granted authority to counties having a population of over 6000 to establish high schools. There are separate schools for colored children. In 1904 there were 3593 teachers in the elementary schools and 78 teachers in the public high schools. Higher institutions of learning maintained by the Territory are as follows: University of Oklahoma, at Norman; an Agricultural and Mechanical College, at Stillwater; the Central Normal School, at Edmond; Northwestern Territorial Normal School, at Alva; Southwestern Normal School, at Weatherford; and the Agricultural and Normal University (colored), at Langston. There are also several sectarian colleges, and not a few academies and private schools. The United States Government maintains schools for the education of the Indians. The largest of these is the Chillico Industrial School, in Kay County.

CHARITABLE AND PENAL INSTITUTIONS. The deaf mutes and insane of the Territory are cared for in private institutions by contract. The insane are kept in a sanatorium at Norman, the contract allowing \$200 per patient. Convicts are cared for by contract in the Kansas State Penitentiary.

HISTORY. Oklahoma was a part of the Louisiana Purchase, and was included in the "unorganized or Indian country" set apart by Congress in 1834. The Creek Indians (June 14, 1866) ceded to the United States the western part of their domain in Indian Territory, for 30 cents an acre, while the Seminoles gave up their entire holdings for 15 cents an acre. The Sacs and Foxes, Cheyennes, and other tribes were settled upon part of these lands, but great tracts remained unoccupied. Though white men were forbidden by law to settle upon these lands, schemes for colonization were developed in 1879. President Hayes issued proclamations both in 1879 and 1880 forbidding settlement, but it was necessary to use troops to dislodge the 'boomers.' Congress in 1885 authorized the President to open negotiations with the Creek and Seminole Indians, for the purpose of opening these vacant

lands to settlement. This was accomplished in 1889. Troops kept the expectant settlers in order until noon of the appointed day, April 22. A mad race for the best lands and town sites ensued. Canvas towns were laid out and each began to lay plans to secure the capital. There was at once a vast influx of settlers, and the population increased at an extraordinary rate. Additional lands were laid open to settlement in 1891, 1893, 1895, 1901, and 1906. There was no government in the Territory until Oklahoma Territory was created (March 2, 1890). The first Legislature met at Guthrie, August 27. The agitation for Statehood began in 1891, and a bill admitting Oklahoma as a State passed the House of the Fifty-seventh Congress, but failed to reach a vote in the Senate. Finally, after prolonged debate, Congress passed on July 16, 1906, the joint Statehood Bill, an act to enable Oklahoma and Indian territories to draft a constitution with a view to admission to the Union as one State under the name of Oklahoma. This act provided that 112 delegates should be chosen in November, 1906, to form a constitution, and that the capital should remain at Guthrie until 1915.

OKLAHOMA, UNIVERSITY OF. A coeducational institution established in 1892 at Norman, Okla., and supported by a general State tax of one-half mill, and by the income from lands reserved in the Cherokee outlet. The university consists of (1) a College of Arts and Sciences, embracing an undergraduate course, in the main elective, a combined course in collegiate and medical studies, and combined courses in collegiate subjects and engineering; (2) a School of Pharmacy; (3) a School of Fine Arts; and (4) a Preparatory School. Tuition is free to residents of Oklahoma and Indian Territory. The total enrollment in 1902 was 359 and the faculty numbered 28. The library contained 8000 bound volumes and 5000 pamphlets. The college property was valued at \$250,000, and the grounds and buildings at \$128,000; the income was \$50,000.

OKLAHOMA CITY. The county-seat of Oklahoma County, Okla., 31 miles south of Guthrie; on the North Fork of the Canadian River; and on the Atchison, Topeka and Santa Fe, the Choctaw, Oklahoma and Gulf, the Saint Louis and San Francisco, the Missouri, Kansas and Texas, the Oklahoma City and Western, and the Oklahoma City and Southeastern railroads (Map: Oklahoma, F 3). It has a Carnegie Public Library, and is the seat of Epworth University, an institution under the joint control of the Methodist Episcopal Church and the Methodist Episcopal Church South. There are various manufactures, principally of flour; important wholesale interests, and a trade in cotton, grain, live stock, fruit, and produce, the city being the centre of a fine farming and stock-raising section. Settled in 1889, Oklahoma City was incorporated two years later. The government is vested in a mayor, elected biennially, and a unicameral council. The water-

works are owned and operated by the municipality. Population, in 1890, 4151; in 1900, 10,037.

O'KRA. See **HIBISCUS**, and Plate of **YAM**, **SWEET POTATO**, ETC.

OKUBO, ô'kû-bô, **TOSHIMICHI** (1830-78). A Japanese statesman and reformer. A native of the warlike clan of Satsuma, he was one of the five leaders in the restoration of the Emperor to power in 1867-68. After the establishment of peace he was equally prominent as the advocate of progressive measures. He was vice-ambassador in the Japanese embassy of 1872-73 which traveled around the world. Going to Peking in 1874, he settled the Formosan difficulty, which threatened war between the two empires. For eight years he was in the Cabinet of the Emperor. In 1877 a portion of the Satsuma clan, led by his old friend and comrade in arms, Saigo, rebelled. But Okubo remained in the Cabinet, aiding in the suppression of the rebellion. In revenge six clansmen of Satsuma killed him while he was on the way to the Emperor's palace, May 14, 1878. He received high posthumous rank, and his sons were ennobled.

OKUMA, ô'kû-mâ, **SHIGENOBU** (1837—). A Japanese statesman, born in the province of Hizen, Kiushiu, in 1837. Okuma was one of the younger leaders in the restoration of the Emperor (1867-68), and upon the conclusion of peace received prominent official positions, distinguishing himself especially by his work in putting the finances of the Empire on a sound basis. In 1881 Okuma seceded from the company of men who were governing Japan and established the Progressive Party, advocating a more rapid advance toward constitutional and parliamentary government. In addition to his work as statesman he established a large school for the teaching of law and political economy and literature, which exerts a wide and an increasing influence. After the establishment of the Parliament Okuma again held high office and continued to be a powerful factor in the public affairs of the nation.

OLAF I., ô'lâf, **TRYGVASSON** (?-1000). King of Norway from 995 to 1000. He was a descendant of Harald Haarfaqr, and in his early years was one of the Vikings who terrorized the coasts of the North Sea, and made descents upon England, Ireland, and France. In 995 he seized the Government of Norway. He had previously been baptized, and he now exerted himself to introduce Christianity among his subjects. Some of the nobles, who refused to acknowledge Olaf's authority, stirred up the rulers of Denmark and Sweden to make war upon him, and he was defeated and slain in a great naval battle in 1000.

OLAF II., surnamed the Saint or the Great (c.995-1030). King of Norway from about 1015 to 1028. He was a son of Harald Gränske, and at the age of fifteen he began his marauding expeditions, which extended to the coasts of Sweden, Germany, France, and Spain. At the age of about twenty he made himself master of Norway, where he completed the establishment of Christianity. (See **NORWAY**.) In 1028 he was driven out by Canute (q.v.) and fled to Russia. He was killed in 1030, in an attempt to recover his kingdom. Because of his zeal for Christianity, he was canonized in 1164 and became the patron saint of Norway.

ÖLAND, ô'länd', or **OELAND**. An island in the Baltic Sea, lying off the southeast coast of Sweden, from which it is separated by Kalmar Sound, from 4 to 17 miles wide (Map: Sweden, G 8). It is included in the Swedish Län of Kalmar. The island is 80 miles in length, and from 4 to 10 miles in breadth, with an area of 510 square miles. It consists mainly of a sandstone ridge scantily covered with soil, but in some parts it is well wooded, and has good pastures, on which cattle and sheep are reared. In favorable seasons, barley, oats, and flax yield good crops. The fishing is excellent all round the coasts. There are large alum-works on the island, and an extensive line of windmills along the Alvar Hills, near which stands Borgholm (population, in 1900, 926). This town is famous for the magnificent ruins of Borgholm Castle. Oeland was often a battlefield in the wars between Denmark and Sweden. Population, in 1890, 37,519; in 1900, 30,408.

OLATHE, ô-lâ'thê. A city and the county-seat of Johnson County, Kan., 21 miles southwest of Kansas City; on the Saint Louis and San Francisco, the Missouri, Kansas and Texas, and the Atchison, Topeka and Santa Fe railroads (Map: Kansas, H 3). It is the seat of the State Institution for the Deaf and Dumb. The adjacent country is largely interested in farming and stock-raising; and the city manufactures flour, bricks, shoes, furniture, etc. There are municipal water-works. Population, in 1890, 3294; in 1900, 3451.

OLBERS, ôl'bers, **HEINRICH WILHELM MATTHÄUS** (1758-1840). A German physician and astronomer, born at Arbergen, a small village near Bremen. He studied medicine at Göttingen from 1777 till 1780, and subsequently commenced to practice at Bremen. After 1779 all the leisure time that he could spare from professional occupations was devoted to the study of astronomy. He first became widely known through his calculation of the orbit of the comet of 1779, which was performed by him while watching by the bedside of a sick patient, and was found to be very accurate. In 1781 he rediscovered the planet Uranus, which had previously been supposed to be a comet, and in 1802 and 1807 respectively discovered the planetoids Pallas and Vesta. He also discovered five comets, in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815, had been some days previously observed in Paris. His observations, calculations, and notices of various comets, which are of value to astronomers, were published in the *Annuaire* of Bode (1782-1829), in the *Annuaire* of Encke (1832), and in three collections by the Baron de Zach. Most of these calculations were made after a new method, discovered by himself, for determining the orbit of the comet from three observations. It is still employed by astronomers under the name 'Olbers's method.' The general equality of the elements of the planetoids led him to propound the theory that the planetoids are fragments of some large planet which formerly revolved round the sun at a distance equal to the mean of the distances of the planetoids from the same luminary. Olbers also made some important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. Con-

sult Schilling, *Wilhelm Olbers: Sein Leben und seine Werke* (Berlin, 1894).

OLCHAS, ol'chaz, or **MANGUN**. One of the North Tungusic tribes dwelling at the mouth of the river Amur, in Asia, and closely related to the so-called Reindeer Tunguses. See **TUNGUS**.

OLD AGE, DISEASES OF. See **SENILITY**.

OLD AGE PENSIONS. Allowances paid to the aged workman either by the Government or by the employer. The term is commonly extended so as to include allowances from a fund to which the recipient has contributed, but which is derived only partially from such contributions. Old age pensions are usually defended on the ground that a large class of laborers are unable to make adequate provision for old age, and hence are certain to become paupers when no longer able to work. Of these aged paupers, a large number have been sober and industrious workers, and for this reason their fate serves to discourage the workmen of the lowest paid classes. Opponents of old age pensions contend that if provision for old age is made by the State, one of the chief incentives to thrift will be removed. Defenders of the plan argue that it is simple justice that a faithful workman should be decently fed and housed when incapacitated for work by age. It is questioned whether such pensions actually discourage thrift; whether the despair of escaping pauperism which is common in certain classes does not do more to destroy industrious habits than a judicious plan of old age pensions. In Europe the provision for old age is a subject of great practical importance. The recognition of State responsibility is an innovation of the last decade. A system of State pensions has been established in Denmark and compulsory insurance obtains in Germany and Sweden. Similar laws have been enacted for coal-miners in Austria (1889), France (1894), Rumania (1895), and Belgium. The State may create institutions for voluntary insurance and may offer inducements to the workmen to insure themselves, as in France and Belgium. Privately organized institutions, e.g. friendly societies controlled by the State, may perform this function, as may also be done through funds set apart by the employer—a common plan in transportation, mining, and the iron and steel business.

Compulsory insurance originated in Germany. Dr. Schaeffle, the founder of State insurance, conceived the plan in 1867. In the early seventies it was generally discussed, and Wagner and other economists gave it their support. The present law (Invalidity and Old Age Insurance, 1889; revised July, 1899) was enacted through the influence of Bismarck, who hoped thereby to check the growth of socialism. All workmen, assistants, journeymen, foremen, engineers, servants, clerks, and teachers, who are sixteen years of age and upward, and who do not receive more than \$500 yearly, must contribute to a pension fund, to which the employer must contribute equal sums, while the Empire adds \$12.50 annually to each annuity and pays the cost of administration. Thirty-one institutions have been provided to which payments are made by means of stamps. Pensions are paid to septuagenarians.

Sweden introduced compulsory insurance in 1889 and Iceland in 1890. A Parliamentary commission to investigate the subject was appointed in Norway in 1894. In Finland old age insur-

ance is voluntary, with local pension funds administered by the State. Denmark (1891) grants small pensions in the form of additional income to the worthy poor. This differs from poor relief in that the recipient retains his right to vote.

In Belgium, the Caisse Général d'Epargne et de Retraite (1850) is guaranteed by the State. The system has rapidly developed since 1891. Subsidies are offered to friendly societies, and the attention of employers is called to the benefits of insurance. The new accounts increased from 568 in 1888 to 43,873 in 1898. In France the Caisse Nationale des Retraites pour la Vieillesse (1850) has not been popular. It is used by the railroads and other corporations which provide pensions for their employees. Among the many corporations which provide old age pensions may be mentioned the Joint Stock Company of Vienne (zinc workers) and the Gas Company of Paris. The pension funds are usually supported by contributions from the employees, but sometimes entirely from the profits of the company.

In England Canon Blackley first initiated the movement for old age pensions, but the name of Charles Booth is chiefly associated with its later development. He advocates granting pensions without regard to age or desert. Several reports of committees of Parliament (notably 1891, 1899) cover the ground extensively. Some trade unions provide pensions.

In 1898 New Zealand passed a pension law granting £18 yearly to citizens of twenty-five years' residence who were sixty-five years of age. Deductions are made when there are other sources of income, so that the stigma of poverty is attached to the scheme.

In the United States there has been no extensive demand for the adoption of the system by the Government, although it has long existed in embryo in the practice of retiring on half pay certain officials, who have served a given number of years or have attained a certain age. There is also a marked tendency among railroads and other large corporations to pension their aged employees. The Chicago and Northwestern Railroad on December 12, 1900, adopted a plan which is being followed by other roads. The pensions are managed by a board of four officials, and all employees may enjoy them. Men seventy years old who have been thirty years in service are retired; those from sixty to sixty-nine who have served thirty years and are incapacitated may be retired at the discretion of the board. The pension amounts to 1 per cent. of the average monthly payment, for the ten years preceding retirement, for each year of service. The Pennsylvania, Illinois Central, Union Pacific, Philadelphia and Reading, and the Grand Trunk have recently adopted pension systems. Among street railways, the Metropolitan, New York (July 1, 1902), provides for the retirement, voluntary and involuntary, of men between sixty-five and seventy-five years of age after a service of twenty-five years. For a continuous service of twenty-five years the pension amounts to 25 per cent. of a workman's salary, and increases with length of service. A number of gas companies have pensioned their aged employees, notably the Consolidated Gas Company of New York City, and the Gas Company of Grand Rapids, Mich. Andrew Carnegie has provided for the pensioning of employees at the Pittsburgh

closely to the characteristic representations of the Indo-Germanic sound-system which mark the Slavic languages (q.v.).

The inflection of Old Church Slavic is full and in many cases primitive in type. The noun has three numbers, singular, plural, and dual; seven cases, nominative, genitive, dative, accusative, vocative, locative, and instrumental; and three systems of declension, nominal, pronominal, and compound. There are six nominal declensions, according as the stems end in -o, -ā, -i, -u, -a, or a consonant. As in other Indo-Germanic languages, the pronominal declension was originally entirely different from the nominal, although transfers from one system of inflection to the other are not infrequent. The compound inflection, peculiar to the Slavic and Scandinavian languages, is formed by adding the pronoun *i* to an adjective or a participle, both parts of which are then declined, as *dobra*, 'of good (man)', *yego* 'of him,' *dobrayego*, 'of the good (man)'. The process, therefore, is precisely analogous to the Scandinavian article suffixed to a noun, as Old Icelandic *borps-ens*, 'of the shield.' The comparative of the adjective is formed by -ys, -eyis, as *krěpākū*, 'strong,' *krěpyii*; *dobrā*, 'good,' *dobrēi*; and the superlative is either the comparative used with superlative force, or is formed by prefixing *nai-* to the comparative, as *naikrěpyii*, 'strongest.' The verb in Old Church Slavic, as in other languages of this group, is either perfective, expressive of a completed action, or imperfective, denoting either a continuous (durative) or interrupted (iterative) action. A durative verb becomes perfective if a preposition is prefixed (as *nesti*, 'to carry,' but *iznesti*, 'to carry out'), while under like conditions an iterative verb becomes durative, or more rarely iterative-perfective. Only two of the original tenses are retained, present and aorist, and only two moods, indicative and imperative, the latter being originally an optative. The Indo-Germanic middle voice has been lost, like the future and perfect tenses, while of the original passive only the present and perfect participles (as *vedomū*, *vedenū*, from *vesti*, 'to conduct') remain. In addition to the active infinitive there is a supine corresponding precisely to that found in Latin (as Latin *datum*, Old Church Slavic *datū*, from *dare*, *dati*, 'to give'). The aorist, inherited from the Pre-Indo-Germanic period, is formed either with or without *s*, the latter class steadily increasing at the expense of the former. The imperfect is specifically a Slavic formation, being made apparently by adding to a datival (or possibly locatival) infinitive an augmented imperfect of the root *as*, 'to be,' as *veděchū*, *veděchū*, from *vesti*, 'to conduct.' The future and perfect, like the pluperfect, future perfect, passive, and conditional, are periphrastic in formation, although the future is often expressed by the present, and the passive by a reflexive made by the active with the reflexive pronoun *se*, 'himself' (as *otū tebe kristiti se*, 'to be baptized by thee,' more rarely *bē napisano*, 'it was written'). In syntax the most noteworthy features are the use of the genitive instead of the accusative after negative verbs, and after transitive verbs in the case of proper names, a usage which probably arose from the desire to avoid the ambiguity resulting from the identity of form of the nominative and accusative singular of masculine nouns; the use of the dative as an absolute case, and the use

of the predicative dative after verbs of becoming (as *i siroloye dētišti ne bōdetū*, 'and the child shall not become an orphan').

Old Church Slavic is written in two alphabets, called Glagolitic and Cyrillic. (See GLAGOLITSA; CYRILLIC ALPHABET.) The literature, which is of considerable extent, and consists altogether of translations, is entirely religious. Besides the Bible, there are versions of the Euchologium, homilies, legends of the saints, and certain apocryphal books.

OLD COLONY. The name given to the territory of the Plymouth Colony in Massachusetts, and later extended to the whole State.

OLD CURIOSITY SHOP, THE. A novel by Charles Dickens (1840). It appeared first as a serial in a weekly publication, *Master Humphrey's Clock*, but was published independently. The keeper of the shop and his grandchild, Little Nell, are driven by poverty to a wandering life, and meet kind friends, among them Mrs. Jarley and the schoolmaster, with whom they find their last refuge. Little Nell dies before help reaches them. Other prominent characters are the hideous dwarf, Quilp, Sally Brass and her brother, Dick Swiveller, and the Marchioness.

OLD DOMINION. Virginia. See STATES, POPULAR NAMES OF.

OLDENBERG, ōl'den-běrk, HERMANN (1854—). A German Orientalist and philologist. He was born in Hamburg, and was educated at Göttingen and Berlin. Upon graduation at the latter university he became privat-docent there, and later professor extraordinarius. He was called to Kiel in 1889 as professor of Sanskrit and comparative philology. He has published *The Dipavamsa* (1879); *The Vinaya Pitakam* (1879-83); *The Theragāthā* (1883); "Vinaya Texts," in Max Müller, *Sacred Books of the East* (1881-85); *Buddha, sein Leben, seine Lehre und seine Gemeinde* (1881; 2d ed. 1890; trans. 1882); *Die Hymnen des Rigveda* (1888); *Die Religion des Veda* (1894); and "Vedic Hymns Translated," in Max Müller, *Sacred Books of the East* (1897).

OLDENBURG, ōl'den-běrk. A grand duchy of the German Empire, composed of the Duchy of Oldenburg and the two principalities of Birkenfeld (q.v.) and Lübeck. The Duchy of Oldenburg, which constitutes the bulk of the State, is bounded by the North Sea on the north, by the Prussian Province of Hanover and the State of Bremen on the east, and by Hanover on the south and west (Map: Germany, C 2). Total area, 2479 square miles. The Duchy of Oldenburg forms a part of the northwestern plain of Germany. It is low and marshy along the coast where it has to be protected from the sea, while the interior, somewhat higher, is mostly sandy and

largely occupied by moors and heaths. The region belongs to the basins of the Weser and the Ems. It is watered chiefly by the Hunte, a tributary of the Weser, and by the Haase and Soeste, both tributaries of the Ems. There are also a number of small streams flowing into the Jade, an inlet of the North Sea, and there is an extensive canal system for draining purposes.

The climate is mild, humid, and somewhat unhealthy in the marshes of the north. About three-fifths of the total area of Oldenburg proper has been brought under cultivation. The land is divided into small holdings, only 69 of the 59,106 holdings of the grand duchy in 1895 containing over 247 acres each. The best land is found in the marshy districts on the north. They produce cereals for export, and are famous for their excellent cattle. In the interior, cereals are the chief product, and the proportion of uncultivated land is much greater. The forest area is small. The manufacturing industries are developed but slightly, and the domestic system of production still largely prevails. The chief manufactures are tobacco, corks, woolen yarn, linoleum, brick, knit goods, etc. The railways of the grand duchy had a total length of 343 miles in 1900, and are all operated by the State.

The throne of the grand duchy is hereditary in the male line. The Constitution, adopted in 1849 and revised in 1852, provides for one chamber, whose members are elected indirectly at the rate of one Deputy for every 10,000 inhabitants. The Landtag ordinarily assembles every three years, and during its intermission is represented by a permanent committee. The principalities of Birkenfeld and Lûbeck have separate provincial diets. The executive power is vested in a responsible Minister representing the Grand Duke. Oldenburg is represented by one member in the Bundesrat, and returns three Deputies to the Reichstag. For the administration of justice the Duchy of Oldenburg has a provincial court of appeal and a supreme court. The principalities of Birkenfeld and Lûbeck are connected for judicial purposes with Cologne and Hamburg, respectively.

The three divisions of the grand duchy have separate budgets, but there is also a common budget for the grand duchy, which derives its revenue from customs duties, State domains, and contributions from its constituent States. The budget of the grand duchy balanced in 1900 at \$901,425. The total estimated revenue and expenditure for the three constituent States in 1900 were \$1,859,511 and \$2,254,776, respectively. The total indebtedness of the three constituent States amounted in 1900 to \$13,295,700. Population of the Duchy of Oldenburg in 1890, 279,008; in 1900, 318,434. The population of the grand duchy was 354,968 in 1890 and 399,183 in 1900. Over three-fourths of the population is Protestant. Capital, Oldenburg (q.v.). Most of the inhabitants are of Saxon stock, but there are also found descendants of the Frisians in the north and west of the Duchy of Oldenburg.

HISTORY. The territory now included in the Grand Duchy of Oldenburg was in ancient times occupied by the Germanic tribe of the Chauzi, who were subsequently merged with the Frisians. In the early centuries of the German Kingdom the dukes of Saxony held sway in the region. A Count of Oldenburg first appears about the

beginning of the twelfth century. In 1247 Count Otho II. founded the town of Delmenhorst, and his descendants were henceforth known as counts of Oldenburg and Delmenhorst. In 1448 Count Christian of Oldenburg became by election King of Denmark. The Reformation was early introduced into Oldenburg. After the death of Count Anthony Günther, without heirs, in 1667, the territories of Oldenburg passed to the royal house of Denmark. In 1773 Christian VII. of Denmark transferred the principality to Paul, Duke of Holstein-Gottorp (the future Paul I. of Russia), who immediately made it over to his cousin, the Prince-Bishop of Lûbeck. In 1777 Oldenburg was raised to the rank of a duchy. The present reigning family is descended from Duke Peter, of the line of Holstein-Gottorp. This Prince in 1808 became a member of the Confederation of the Rhine. He soon grew restive under the obligations imposed upon him by Napoleon, and, abandoning the French alliance, left the country, which was thereupon (1810) annexed to the French Empire. The victories of the Allies restored Peter to power in 1813. The Congress of Vienna increased the territory of Oldenburg, and raised it to the rank of a grand duchy. The secularized See of Lûbeck had been annexed to the principality in 1803. The revolutionary movement of 1848 affected Oldenburg, and in 1849, after having lived for centuries without even a show of constitutional or legislative freedom, the country entered suddenly into possession of the most liberal of constitutions. The reaction in favor of absolutism, which the want of purpose of the popular party induced, led in 1852 to a revision and modification of the Constitution. In the Seven Weeks' War Oldenburg sided with Prussia, and afterwards joined the North German Confederation. In 1866 a treaty was concluded with Prussia, by which the Grand Duke renounced his claims to the Holstein succession in return for the cession of a small portion of Holstein territory and an indemnity. In 1871 Oldenburg became part of the new German Empire.

Consult: *Jahrbuch für die Geschichte des Herzogtums Oldenburg* (Oldenburg); Kollmann, *Das Herzogtum Oldenburg* (ib., 1893); Erdmann, *Geschichte der politischen Bewegungen in Oldenburg* (ib., 1897); Pleitner, *Oldenburg im 19. Jahrhundert* (ib., 1899-1901).

OLDENBURG. The capital of the Grand Duchy of Oldenburg, Germany, on the Hunte, and the Hunte-Ems Canal, 25 miles west of Bremen (Map: Germany, B 2). Its Church of Saint Lambert, built in the thirteenth century, and restored in 1874, contains the vaults of the reigning family. The palace, surrounded with fine gardens, has a choice collection of paintings and sculptures, and a large library. The city has a museum of natural history, a gymnasium, a higher *Realschule*, and a public library of over 100,000 volumes. There are manufactures of glass, cigars, leather, machinery, and musical instruments. There is a trade in grain and cattle. Population, in 1890, 23,118; in 1900, 26,635. Oldenburg is mentioned as early as 1108. It became a city in 1345.

OLDENBURG, HOUSE OF. A princely family which has given rulers to a number of European countries. Count Dietrich the Fortunate, of Oldenburg, married in 1424 the daughter of Ger-

hard VI., Duke of Schleswig-Holstein. His eldest son, Christian, was chosen King of Denmark (1448) and of Norway (1450), and Duke of Schleswig-Holstein (1460), thus founding (1) the royal line of Denmark, which became extinct in 1863, in the person of Frederick VII. A younger son of Dietrich continued the line of Oldenburg which became extinct in 1667. Adolph, son of Frederick I. of Denmark, founded (2) the ducal line of Gottorp, whose representative, Duke Charles Peter Ulrich, ascended the Russian throne in 1762 as Peter III. A grandnephew of Peter III., Adolph Frederick, was chosen King of Sweden in 1751, while a younger brother of Adolph Frederick became the founder of the new grand ducal line of Oldenburg. (3) The ducal line of Sonderburg founded by John the Younger, the third son of Christian III. of Denmark, fell apart into a number of lines, of which the line of Augustenburg alone survives. (4) The line of Beck or Glücksburg was founded by a grandson of John the Younger. Prince Christian, fourth son of Duke William of this line, ascended the Danish throne in 1863 as Christian IX. (q.v.). His second son, George, became in the same year King of Greece.

OLD ENGLISH. See ENGLISH LANGUAGE; ENGLISH LITERATURE; ANGLO-SAXON LANGUAGE AND LITERATURE.

OLD-FASHIONED GIRL, AN. A story by Louisa M. Alcott (1869). It was begun as a serial for *Merry's Museum*, a child's magazine, and afterwards enlarged. The cheery, unaffected little heroine is effectively contrasted with some gay city friends.

OLD-FIELD, ANNE (1683-1730). A noted English actress. Though she was of good birth, her family was in humble circumstances, and she was apprenticed to a seamstress in Westminster, till as a girl she attracted the attention of Farquhar by her beauty and her expression in reading a play. She was then given an opportunity at Drury Lane. At first the critics were doubtful of her dramatic gifts, but she made steady progress in her art and became the foremost actress of her time. One of her greatest successes was as Lady Betty Modish in Colley Cibber's *Careless Husband* (1704), and she created many parts in the 'genteel comedy' of the period, though she long felt a reluctance to tragedy. Yet she created the rôle of *Jane Shore* (1714), and was a superb Cleopatra in Cibber's *Cæsar in Egypt* (1724), and her acting of Sophonisba (1730), her last new rôle, was said to have thrilled even the actors upon the stage. Her private life furnished occasion to the gossips, and she was the acknowledged mistress of Arthur Mainwaring, and after his death of Gen. Charles Churchill. She was nevertheless on intimate terms with the great ladies of her day, and she was buried in Westminster Abbey. Consult: *the Authentick Memoirs of the Life of that Celebrated Actress, Mrs. Ann Oldfield* (London, 1730); Geneste, *History of the English Stage* (Bath, 1832); Doran, *Annals of the Stage*, ed. by Lowe (ib., 1888); Baker, *English Actors from Shakespeare to Macready* (New York, 1879); Russell, *Representative Actors* (London, 1872?).

OLD-FIELD LARK. A local name in the Southern United States for the meadow-lark (q.v.).

OLD FOLKS AT HOME. One of the most famous of Southern plantation songs (1850). First line: "Way down upon the Suwanee Ribber." Both words and music are by Stephen Collins Foster, and were written before the author reached the age of twenty years. He realized the sum of \$15,000 for the song, which still continues in undiminished popularity.

OLD FORGE. A borough in Lackawanna County, Pa., four miles southwest of Scranton; on the Lackawanna River, and on the Delaware, Lackawanna and Western, the Lehigh Valley, and the New York, Susquehanna and Western railroads (Map: Pennsylvania, F 2). It is in the anthracite region and is principally engaged in coal-mining. There are also a silk mill, large chemical and fertilizer works, and a glass-blowing plant. The high-school building is one of the finest in the county. The government is vested in a burgess, elected every three years, and a borough council. Settled in 1830, Old Forge was incorporated in 1899, having been organized from a part of the township of the same name. Population, in 1900, 5630.

OLD GRIMES. A poem and popular song by the American writer Albert G. Greene (1802-68), the name being taken from one of Crabbe's metrical tales.

OLD GUARD, THE. The name borne by a select body of French troops during the First Empire. It was created by Napoleon I. in 1804 out of the preëxisting Consular Guard and comprised picked men from every arm of the service. The Old Guard had its own general staff and received orders only from its own commander. Subsequently the name was usually restricted to a body of infantry consisting of three regiments of grenadiers and two regiments of chasseurs. The Old Guard played a leading part in the Napoleonic battles and suffered proportionately, its numbers after the Russian campaign being reduced to 500 men. In 1812 the Young Guard was created to act as a source of supply for the Old Guard. The latter, greatly increased in number, ended its career in glory in the last desperate charge at Waterloo.

OLDHAM, old'am. A manufacturing town in Lancashire, England, on the Medlock, seven miles northeast of Manchester (Map: England, D 3). The parish church, the town hall, the Blue-Coat and the grammar schools, are the chief edifices. With its incorporation as a town in 1849, its municipal activity commenced. It owns its gas and water since 1853, electric lighting plant, tramways, baths, wash-houses, hospitals, cemeteries, markets, libraries, art gallery, technical school, and the Alexander Park of 60 acres. Modern destructors and installations dispose of refuse and sewage. Oldham owes its rapid increase in population and wealth to the extensive coal mines in the vicinity, and to its cotton manufactures, which engage 300 mills with more than 12,000,000 spindles. The damp air of the region gives the humidity necessary for the spinning of yarn. It is also celebrated for its manufactures of machinery for cotton-spinning and wool-weaving. In 1760 it was a village of 60 houses. Population, in 1801, 12,000; in 1851, 52,800; in 1891, 131,500; in 1901, 137,200.

OLDHAM, JOHN (c.1600-1636). An early settler in New England. He was born in England

in 1600, and emigrated to Plymouth in 1623. In 1624 he and an Episcopalian minister named John Lyford conspired against the Government of Plymouth and dispatched letters containing charges against the established authorities to England. The plot was detected, and Oldham was banished from the colony, although he later became reconciled with the inhabitants and rendered them some services. Settling in the Massachusetts Bay Colony, he became a man of prominence, and was a deputy from Watertown to the first General Court of Magistrates and Representatives. In 1636, while he was on a trading expedition, his pinnace was treacherously captured near Block Island by Indians, and he was killed. His murder was the immediate cause of the famous Pequot War.

OLDHAM, JOHN (1653-83). An English satirical poet, born at Shipton-Moyné, near Tetbury, in Gloucestershire. He graduated at Saint Edmund Hall, Oxford, in 1674, and the next year became usher in a school at Croydon. Four years later he left Croydon to become tutor to the grandsons of a retired judge named Sir Edward Thurland, with whom he remained until 1681, when he became tutor to the son of Sir William Hickes. During his latter years he was aided by William Pierrepont, Earl of Kingston, at whose home he died. Oldham's poems, some of which possess real merit, had considerable influence on Pope and other English poets of the succeeding century. Among them are the satires *To a Friend About to Leave the University*, which he wrote while occupying his position at Croydon; *Satires upon the Jesuits* (1681), which reflect the panic-stricken condition of the people after the alleged discovery of 'the Popish plot'; and a *Satire Against Virtue* (1681), which was taken so literally by the public that its author was compelled to explain in an *Apology* and a *Counterpart*. Though Oldham produced poems other than satirical, these and some adaptations of Horace and Juvenal are the works on which his reputation rests. Consult Thompson, *The Compositions in Prose and Verse of Mr. John Oldham, to Which are Added Memoirs of His Life* (3 vols., 1770).

OLDHAMIA (Neo-Lat., named in honor of Thomas Oldham, an English geologist of the nineteenth century). The oldest known fossil alga, found in Cambrian rocks of Ireland. The type species, *Oldhamia antiqua* of Forbes, appears to be a coralline alga, while another species, *Oldhamia radiata*, is of uncertain affinity and may be a worm trail or even a series of minute wrinkles produced by distortion of the slate rocks upon which it is found. *Oldhamia* is of very doubtful occurrence in the Cambrian of America.

OLD HICKORY. An affectionate nickname of Andrew Jackson, given because of his tough and unbending characteristics.

OLD HUNDRED. A favorite hymn tune. By some the music is credited to Guillaume le Franc, a musician of Rouen, but is probably an adaptation of a popular tune of the fifteenth century. The melody was adapted to Beza's version of Psalm cxxiv., included by him in the Geneva Psalter, the first copy of which, with his additional tunes, was printed in 1554. It was arranged by Louis Bourgeois, the musical editor of that book. The tune is found with different endings in the Flemish Psalter (Antwerp, 1540);

in the Dutch Psalter (London, 1561); in the Psalms with music by Marot and Beza (Lyons, 1563); in Claude Goudimel's famous collection of tunes (Paris, 1565); and also in English and German tune-books. In England it was sung to Kethe's version of the hundredth Psalm, "All people that on earth do dwell," and called the "Hundredth Tune." The word 'old' was added in Brady and Tate's new version of the Psalter (London, 1596). Another name is "Savoy." Consult: Bovet, *Histoire du psautier des églises réformées* (Neuchâtel and Paris, 1872); and Fitzgerald, *Stories of Famous Songs* (London, 1897).

OLD IRONSIDES. The name popularly given to the United States frigate *Constitution* (q.v.).

OLD JEWRY. A street in London, near Mercer's Hall, deriving its name from the Jews, who were settled there before their persecution in 1291. On the site of their former synagogue stands Grocers' Hall.

OLD KENTUCKY HOME. A well-known plantation melody by Stephen Collins Foster (1850), beginning: "The sun shines bright in the old Kentucky home."

OLD LADY OF THREADNEEDLE STREET. In popular language, a name frequently given, from its location, to the Bank of England.

OLD LAW, THE, OR A NEW WAY TO PLEASE YOU. A comedy by Middleton, Massinger, and Rowley, published in 1656. An earlier version was written by Middleton in 1599, and was altered by Massinger and Rowley into the later form. The 'law' was the compulsory removal of all aged men and women, which was modified in the course of the play.

OLD LIGHT ANTI-BURGHES. See BURGHES AND ANTI-BURGHES.

OLD LINE STATE. Maryland. See STATES, POPULAR NAMES OF.

OLD MAN OF THE MOUNTAIN. The name applied in mediæval times to the ruler of the Assassins (q.v.).

OLD MAN OF THE SEA. A monster in the form of an old man, described in the *Arabian Nights' Entertainments*. Sindbad the Sailor met him and took him on his shoulders in order to assist him, but was unable to release himself from the clutch of the old man until he made him drunk and so released his hold. The expression is used to describe any bore or incubus from which release is difficult.

OLD (WISLER) MENNONITES. See MENNONITES, section *The Old, or Wisler, Mennonites*.

OLDMIX'ON, JOHN (1673-1743). An English historian, born at Axbridge in Somerset. During his early life he wrote a number of poems and plays, but in 1708 turned his attention to more serious work and published *The British Empire in America*. For a number of years he enjoyed the perquisites of the post of collector of the port at Bridgewater, but spent three years in London writing one of his histories, and then found that his deputy at Bridgewater had involved him in a debt for £360; whereupon he turned over the arrears of his salary and resigned. His histories are now of little value, as they were written for party purposes. His attacks on Pope led the latter to give him a place

in the *Dunciad*. The titles of some of his works are: *The Secret History of Europe* (1712-15); *The History of England During the Reigns of the Royal House of Stuart* (1730); and *The Arts of Logick and Rhetorick* (1728).

OLD MORTALITY. A novel by Sir Walter Scott (1816). The title is taken from the nickname of Robert Paterson, who for years Rept in order the tombstones of the Covenanters. The story purports to have been told by him to the author as Cleishbotham, and describes the conflict of the Covenanters with the royal forces under Claverhouse, about 1670.

OLD NORTH STATE. See NORTH CAROLINA.

OLD OAKEN BUCKET, THE. A very popular song by Samuel Woodworth, written in New York in 1817 and first published under the title of "The Bucket." The air is an adaptation by Frederick Smith of Kiallmark's music composed for Moore's "Araby's Daughter."

OLD PERSIAN. The ancient Iranian language of Persia. Its entire grammatical structure is closely akin to Avesta (q.v.). The inadequacy of the alphabet in which it is written (see CUNEIFORM INSCRIPTIONS) and the scantiness of the remnants of the language, however, prevent a complete knowledge either of its phonology or morphology. Its principal phonological characteristics are as follows: Indo-Germanic *r* is represented by *ar*, as Skt. *kṛta*, 'deed,' Old Pers. *karta*; Indo-Germanic nasalized vowels lose their nasalization, at least in the script, as Skt. *āśamsam*, 'I said,' Old Pers. *āšaham*; epenthetic *u* is developed between *d* and *r*, and between *g* and *d*, as Skt. *adruhyat*, 'he deceived,' Old Pers. *adārūjiya*, Av. *Suṛjā*, 'Sogdiana,' Old Pers. *Sugāda*, *Suguda*; Indo-Germanic *tr* becomes *θ*, as Skt. *putra*, 'son,' Old Pers. *puθa*; Indo-Germanic *i*, *u*, are written *iy*, *uv* after consonants, as Skt. *yadi*, 'if,' Old Pers. *yadiy*, Skt. *dadātu*, 'let him give,' Old Pers. *dadātuv*; Indo-Germanic *ti* becomes *š*, as Skt. *mṛtyu*, 'man,' Old Pers. *mārītiya*; Indo-Germanic final *t* and *d*, the only final consonants remaining in Iranian, are lost in Old Persian, as Skt. *abharat*, 'he bore,' Old Pers. *abara*, but Av. *baraṭ*; Indo-Germanic *s* is lost, at least in the script, before *u*, *r*, and *m*, as Skt. *svāva*, 'rich in horses,' Old Pers. *uvāspa*, Skt. *asmi*, 'I am,' Old Pers. *amiy*, Skt. *srōtas*, 'river,' Old Pers. *rauta*; Iranian *s* and *z* become *θ* and *d* before vowels and *r*, as Av. *sarōda*, 'sort,' Old Pers. *θarda*, Av. *nisrinaomi*, 'I restore,' Old Pers. *niyaθ arayam*, 'I restored.' The inflection, so far as it can be reconstructed, does not differ essentially from Avesta, except that the imperfect tense of the Old Persian verb invariably has the augment which is usually lacking in Avesta, as Old Pers. *adada*, 'he gave,' Av. *daθaṭ*. The attempt which has been made by certain scholars to prove the existence of various dialects in the extant Old Persian texts can scarcely be regarded as successful.

The Old Persian records, apart from glosses and proper names, consist of a number of cuneiform inscriptions carved by the Achaemenian Kings Cyrus, Darius I., Xerxes I., Artaxerxes I., Artaxerxes Mnemon, and Artaxerxes Ochus. These inscriptions are chiefly at Behistun, Persepolis, Naks-i-Rustam, Elvand, Van, Susa, and Suez. Of them by far the most important are the five tablets, amounting to 410 lines,

and a few minor texts, carved by order of Darius I. on the mountain-side at Behistun (q.v.). Here the King relates his history in a dignified tone, which in the fourth tablet rises to some degree of literary merit. Next in importance is the inscription of Darius at Naks-i-Rustam (see PERSEPOLIS) in sixty lines, conspicuous for its stylistic merit, and two briefer texts, of 24 lines each, of the same King at Persepolis. The texts of Xerxes and the three Artaxerxes are little more than replicas of the minor tablets of Darius. In the latest inscriptions, especially in the single one of Artaxerxes Mnemon, set up by him at Susa, a decay in grammar seems evident. The style of the Old Persian inscriptions, which shows marked traces of literary influence from the Assyro-Babylonian tablets, is simple narrative, and in general the meaning of the words is tolerably certain. There are, however, a number of difficult passages, where the Babylonian and New Susian versions carved side by side with the Persian inscription of Behistun give no help. This Babylonian translation is, unfortunately, very fragmentary, while the New Susian, interpreted only by identifying words in it which correspond to known Old Persian terms, is not a safe guide in doubtful passages. There are a number of gaps in the Old Persian inscriptions, and the reading of several words is not yet determined. It is almost certain that there are other Old Persian inscriptions which have not yet been discovered, and which when found may give a solution of at least some of the problems which now beset the interpretation of these texts.

OLD POINT COMFORT. A frequented watering place in Elizabeth City County, Va., six miles north of Norfolk (Map: Virginia, H 5). Its location on a small peninsula, where Hampton Roads and Chesapeake Bay join the Atlantic Ocean, is one of great natural beauty. A fine beach for bathing and good boating and fishing, together with the activities of garrison life at Fort Monroe (q.v.), situated here, are prominent

attractions. The climate is remarkably mild and equable. There is a large hotel, besides several cottages, and the resort is frequented in both summer and winter.

OLD PROBABILITIES. A popular American nickname for the head of the Weather Bureau, or loosely for the personification of weather prophecies in general.

OLD PRUSSIAN LANGUAGE. An extinct member of the Baltic group of Indo-Germanic languages which was spoken until the seventeenth century in Prussia. The remnants of the language are very scanty, and are too meagre to permit a reconstruction of the grammar. The Old Prussian fragments consist of translations of two catechisms, printed in 1545, and of the Short Catechism of Luther (1561). There are also two Old Prussian-German vocabularies, that of Elbing, compiled in the first half of the fifteenth century, containing 802 words, some of which, however, are loan-words, and that of Grunau, who composed a list of 100 words between 1517 and 1526. This vocabulary of Grunau is so inaccurate as to be of little value. The Elbing list, on the contrary, if used with caution, is the most valuable source of our knowledge of the language next to Luther's catechism. The chief phonological characteristics of Old Prussian are as follows: Indo-Germanic *ð* remains *ð* in Old Prussian under the circumflex accent, but becomes *t* under the acute, as *semme*, 'earth,' accented on the ultimate like the equivalent Russian *zemlyá* but with the circumflex like Lithuanian *duktė*, 'daughter'; *turrit*, 'to do,' Lithuanian *turėti*. Indo-Germanic *a* becomes *a* in Old Prussian as in the other Baltic dialects (Lettic and Lithuanian), as Latin *oculus*, Old Church Slav. *oko*, 'eye,' but Old Prussian *ackis*, Lithuanian *akys*, Lettic *aza*, while *o*, like *a*, is represented by *a* or, after gutturals, by *u* in Old Prussian, *o* (*u*) in Lithuanian, and *a* (*u*) in Lettic, as Gothic *frōps*, 'wise,' Old Prussian *prātin*, 'counsel,' Lithuanian *prōtas*, 'understanding,' Lettic *prāts*, 'will,' but Old Latin *hemōn*, 'man,' Old Prussian *smāni*. Indo-Germanic *r*, *l*, *n*, *g* become in Old Prussian as in the other Baltic dialects *ir*, *il*, *im*, *in*, as Sanskrit *vr̥thā*, 'in vain,' Old Prussian *prawlits*, 'to betray,' Lithuanian *vilstu*, Lettic *wilt*, 'to deceive.' In script at least there is no distinction between *s* and *z*, as Skt. *dāsa*, Latin *decem*, Old Prussian *dessimtons*, Lithuanian *dėszimtis*, 'ten,' Old Church Slav. *deseti*, but Sanskrit *jñā*, Greek *γινώσκειν*, Old Prussian *posinnāt*, Lithuanian *zinoti*, Lettic *žināt*, Old Church Slav. *znati*, 'to know.' In accent Old Prussian seems to have resembled Lettic rather than Lithuanian. The Old Prussian long diphthongs, long vowel plus liquid, and nasal plus consonant, therefore correspond, like the Lettic acute accent, to the Lithuanian circumflex, while like combinations with unlengthened vowel correspond, like the Lettic lengthened vowel, to the Lithuanian acute. The noun had five cases, nominative, accusative, genitive, dative, and vocative, as well as a few traces of an instrumental. The original Indo-Germanic terminations are, in general, well preserved, as dative singular *wirdai*, 'to the word,' Lithuanian *važdui*, cf. Avesta *vahrkai*, Greek *λόγῳ*, 'to the wolf'; accusative plural *wirdans*, 'words,' cf. Cretan Greek *λόκους*, Gothic *wulfans*, 'wolves'; genitive plural, as *grikan*, 'of sins,'

Lithuanian *grėkū*, Lettic *griku*, cf. Vedic Sanskrit *vr̥kām*, 'of wolves,' Greek *λόκων*, Latin *deum*, 'of gods.' On the other hand, the genitive singular of *s*-stems is borrowed from those in *-a*, as *Deivas*, 'of God' (cf. *genmas*, 'of a woman,' Greek *χώρας*, 'of a country'), but Lithuanian *vilko*, 'of a wolf,' Lettic *vilka*, Old Church Slav. *vlāko*, and the dative plural receives an *s* from the accusative plural, as *auschautenikamans*, 'to debtors,' but Lithuanian *rañkomus*, *rañkoms*, 'to hands,' Lettic *rūkeem*, Old Church Slav. *raikomū*. The verb has a present and past indicative, an imperative (optative), an optative of secondary formation, present and past active and passive participles, and an infinitive. The third person plural, as in the other Baltic dialects, coincides in form with the singular. The ending is *a*, as *senrinka*, 'he gathers,' Lithuanian *reika*, and is a relic of the Indo-Germanic present injunctive, as Sanskrit *codayat*, 'he is to rouse.' The first person singular is also old, as *imma*, 'I take,' Greek *ἔγω*, 'I loose.' The infinitive appears in three forms, undifferentiated in meaning, as *dātwei*, *dāton*, *dāt*, 'to give.' The form *dātwei* is usually compared with such Vedic Sanskrit infinitives as *dhātavē*, 'to place,' while *dāton*, like Lithuanian *deyti*, and Old Church Slav. *děti*, is to be compared with Sanskrit *dhatum*, Latin *con-ditum*, 'to place.' The explanation of such infinitives as *dāt* is not yet clear. Consult: Nesselmann, *Die Sprache der alten Preussen* (Berlin, 1845); id., *Thesaurus Linguae Prussicae* (ib., 1873); Berner, *Die preussische Sprache* (Strassburg, 1896).

OLD RED SANDSTONE. The name given to a large series of Paleozoic rocks, of which red sandstones are the most conspicuous portions, but which contain also white, yellow, or green sandstones, as well as beds of clay and limestone. The group lies below the Carboniferous strata, and was called 'Old' to distinguish it from a newer series of similar beds which occur above the coal measures. The discovery that the highly fossiliferous calcareous rocks of Devonshire and the Continent occupied the same geological horizon, showed that the name was very far from being descriptive of all the deposits of the period, and suggested to Murchison and Sedgwick the desirability of giving them a new designation. They consequently proposed Devonian, which has been extensively adopted. The name has been rendered classical by Hugh Miller in his books, *The Old Red Sandstone*, and *Footprints of the Creator*. The formation which has been laid down in inland seas is noted for its abundant fish remains.

OLD ROWLEY. A popular name of Charles II. The name is derived from Rowley, a favorite horse of the monarch, and is also explained as alluding to the saying "A Roland for an Oliver," referring to the relations of Oliver Cromwell and Charles.

OLD SCHOOL (or PRIMITIVE) BAPTISTS. See BAPTISTS.

OLD SLOVENIAN. See OLD CHURCH SLAVIC LANGUAGE AND LITERATURE.

OLD SQUAW, or OLD WIFE. A sea-duck (*Clangula hyemalis*) of all northern regions, easily recognized by its much elongated tail feathers; the 'long-tailed duck.' See DUCK.

OLDSTYLE, JONATHAN. The pseudonym under which Washington Irving contributed to the *New York Morning Chronicle*, in 1802.

OLD TOWN. A city in Penobscot County, Maine, 12 miles north-northeast of Bangor; on the Penobscot River, and on the Maine Central and the Bangor and Aroostook railroads (Map: Maine, F 6). It has a public library and a city hospital; and among the prominent buildings are the city hall, high school, and Odd Fellows Block. The lumber interests of the city are very important, and there are also manufactories of wood pulp, bateaux and canoes, boots and shoes, woolens, patent medicines, chemical fibre, and machinery and foundry products. Under a revised charter of 1895, the government is administered by a mayor, annually elected, and a unicameral council. Settled about 1820, Old Town was set off from Orono and incorporated as a town in 1840, and in 1891 was chartered as a city. Population, in 1890, 5312; in 1900, 5763.

OLD UNCLE NED. One of Stephen Collins Foster's popular negro songs (1847), beginning "There was an old darky and his name was Uncle Ned."

OLD WIVES' TALE, THE. A farce or interlude by George Peele, printed in 1595, but acted probably in 1590. The plot of this lively farce is taken from Ariosto, but its chief interest is the fact that it suggested to Milton the plan of *Comus*. The troupe who act part of the *Tale* are transformed into the Lady, the Brothers, and Spirit of the poem.

OLD WOMAN'S SUMMER. See **INDIAN SUMMER.**

OLDYS, δλδ'ς, WILLIAM (1696-1761). An English antiquary; natural son of Dr. William Oldys, a civil lawyer. He seems to have been born in London. He inherited some property from his father, but lost heavily through connection with the 'South Sea Bubble' in 1720. For several years he aided Dr. Knowles in editing the *Earl of Strafforde's Letters and Despatches* (2 vols., 1739). During this time, also, he collected a valuable library, which he sold in 1731 to the Earl of Oxford, whose literary secretary he became in 1738. After Oxford's death, in 1741, Oldys's life became one of drudgery and hardship. For a number of years he collaborated with Dr. Johnson in preparing a catalogue of the Oxford library, which had been purchased by Thomas Osborne, the bookseller; but in 1751 he was imprisoned in the Fleet for debt, and remained there two years before friends came to his aid. In 1755 the Duke of Norfolk secured for him the post of Norroy king-at-arms, which he kept until shortly before his death. His works, which have been often used by later writers, show deep learning and thorough research. Among the best known is the *Life of Raleigh*, originally prefixed to the *History of the World* (2 vols., 1736), and later to the collected edition of Sir Walter's *Works* (8 vols., Oxford, 1829). Another valuable work is his *British Librarian* (1737), a critical catalogue; and almost equally useful are his annotations and notes on the works of earlier writers. Consult Yeowell. *A Literary Antiquary: Memoir of William Oldys, Norroy King-at-Arms* (London, 1862).

OLEAN, δ'λ'ε-άν'. A city in Cattaraugus County, N. Y., 70 miles south by east of Buffalo; at the confluence of the Allegheny River with Olean Creek, and on the Erie, the Pennsylvania, and the Pittsburgh, Shawmut and Northern railroads (Map: New York, B 3). It has the Foreman Library, General Hospital, a State armory, a fine high-school building, and City Park. The driving park here has been the scene of famous races; and in the vicinity is the well-known 'Rock City,' a collection of massive conglomerate rocks. Olean is noted for its extensive oil and lumber interests. Owing to the proximity of the Pennsylvania oil fields, it is a storage place for large quantities of petroleum, and the terminus of several pipe lines. Leather interests also are prominent, and great hemlock forests are near by. The industrial establishments include oil refineries, tanneries, planing mills, stave, heading, and barrel factories, carriage and wagon works, railroad shops, marble works, foundries, glass factories, brick yards, flouring mills, a brewery, and bicycle works. Settled in 1804, Olean was chartered as a city in 1893, the charter of that date now being in operation, and providing for a government vested in a mayor, elected biennially, and a unicameral council. The water-works are owned and operated by the municipality. Population, in 1890, 7358; in 1900, 9462.

OLEANDER (Fr. *oléandre*, Sp. *oleandro*, *eloendro*, ML. *arodandrum*, corrupted by popular etymology with Lat. *olea*, olive tree, from Lat. *rhododendron*, Gk. *ροδοδένδρον*, oleander, from *ροδον*, *rhodon*, rose, + *δένδρον*, *dendron*, tree), *Nerium*. A genus of plants of the natural order Apocynaceæ. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The common oleander (*Nerium Oleander*),

OLEANDER.

a native of the Mediterranean region and many of the warmer temperate parts of Asia, is frequently planted in many countries as an ornamental shrub, and is very common in northern latitudes as a house plant. It has beautiful red or sometimes white flowers. The English call it rose bay, and the French rose laurel (*laurier rose*). It attains a height of 8 to 10 feet. Its flowers give a splendid appearance to many ruins in the south of Italy. It delights in moist situations, and is often found near streams.

spines, and there was a long slender spine at the end of the tail or pygidium. See *TRILOBITA*.

OLENUS (Neo-Lat., from Lat. *Olenos*, Gk. *Ὀλένος*, name of a man changed to stone). A trilobite from the Upper Cambrian and Lower Ordovician formations of Europe. See *TRILOBITA*.

O'LEOGRAPH (from Lat. *oleum*, oil + Gk. *γράφειν*, *graphein*, to write). A chromo-lithograph which has been 'roughed' on a lithographic stone engraved so as to imitate canvas. The resemblance to oil-painting is further increased by mounting the oleograph on canvas, sizing and varnishing. The colors used in printing oleographs are a little darker than in the case of chromo-lithographs in imitation of water-color paintings.

OLEOMARGARINE, *ô-lê-ô-mär-gä-rîn* (from Lat. *oleum*, oil, Eng. *margarine*, from Lat. *margarita*, from Gk. *μαργαρίτης*, *margaritēs*, pearl, from *μαργαρος*, *margaros*, pearl-oyster), **ARTIFICIAL BUTTER**, or **BUTTERINE**. An artificial or manufactured substitute for dairy butter, made from 'oleo-oil' and other fatty substances worked together with coloring matter. The material originated in France, as the result of a prize offered at the instance of Napoleon III. for the best substitute for butter. This was awarded in 1869 to Hippolyte Mège, whose process, considerably modified, is still employed in the manufacture of oleomargarine. In preparing oleo-oil, the fat that is removed from beef animals at the time of slaughtering is thoroughly washed in warm water, and chilled and hardened by means of ice water. It is then finely cut up by machinery and melted in steam-jacketed caldrons at about 160° F. (71° C.), after which it is allowed to settle. Salt is scattered over the surface of the fat, which accelerates the settling of the fibre or membrane. After the first settling the clear oil is siphoned to a second series of jacketed caldrons, where more salt is added and the temperature controlled until the second settling is completed, when it is siphoned into vats, in which it is allowed to stand from three to five days at a temperature favorable to the crystallization of the stearin. The mass is then thoroughly mixed, wrapped in cloths and submitted to powerful pressure, which separates the oleo-oil from the stearin. Several grades of oleo-oil are made, the quality depending upon the grade of animals and the part of the body from which the fat is obtained. Neutral lard, or 'neutral,' another important constituent of oleomargarine, is prepared from the leaf and the back fat of the hog, the best grade coming from the leaf. Cottonseed oil enters quite largely into the composition of oleomargarine, especially of the cheaper grades. These fats are mixed in various proportions by different manufacturers, each having his own working formula. So much depends on the 'handling' of the oils and the regulation of the temperature at each successive stage, that different manufacturers using the same grade of oils in similar combinations will secure quite different results. The oleo-oil and the neutral lard are each melted in separate tanks, and are piped into a mixing tank mounted on scales, so that the exact proportions called for by the formula may be used. If cottonseed oil is used, it is added at this stage. The mixed fats are piped to the churn, where the

melted butter, cream or milk, and the coloring matter are added. Milk is used much more commonly than butter or cream, and this is 'ripened' or fermented with a special culture of bacteria to give a pronounced lactic-acid flavor resembling that of butter. The mixture is then churned, and the liquid oleomargarine is drawn into a vat of ice water, which chills and hardens it before it can crystallize; after which it is softened by standing in the 'tempering room,' worked in a machine butter-worker, salted, and put up in tubs or rolls.

There are various grades of oleomargarine, depending upon the grades and proportions of the materials used. The cheapest grades are made from low-grade oils obtained from 'scrap' fat and made firm by the addition of stearin or similar substance, so that a greater proportion of cottonseed oil can be employed. Such grades are churned with skim milk, or buttermilk, and glycerin is sometimes added to improve the appearance of the product. The highest grades are made from pure oleo-oil and neutral lard of the best quality, with little or no cottonseed oil, and are churned with whole milk, cream, or creamery butter.

Butterine is a commercial name for oleomargarine, which was originally used to indicate a product of a higher grade or containing a considerable proportion of butter. The term now has no special significance in trade, and is not used in the oleomargarine laws, although still employed by some dealers for obvious reasons.

When made from good stock, oleomargarine is a cleanly, wholesome, and nutritious article of food. Numerous experiments have shown it to possess a food value practically equal to that of butter, and it has the advantage of keeping better and longer than butter, as it does not tend to become rancid. It has not the delicate flavor of the best butter, but with most people the objection to it is founded on sentiment and on its fraudulent sale, a large proportion of it being sold to the retail consumer as butter. Stringent laws have been made to regulate its manufacture and sale, requiring it to be labeled and taxing it heavily when colored in imitation of butter. The object of these laws has, however, been very largely defeated by the ingenuity of manufacturers, and oleomargarine is now placed on the market which apparently contains no artificial coloring matter, and yet imitates the color of butter very closely.

The production of oleomargarine in the United States has increased enormously in recent years. In 1890 there were, according to the census, 12 factories. In 1900 there were 24. The output for the fiscal year 1890, as shown by the returns of the Treasury Department, was 32,324,032 pounds; in 1900 it was 107,045,028 pounds; and in 1902, 126,316,436 pounds. In the fiscal year 1900 the taxes paid into the Treasury Department by the industry amounted to \$2,543,785. The exports of oleomargarine in the fiscal year 1900 amounted to 4,182,536 pounds, valued at \$409,083; and of oleo-oil, 146,739,681 pounds, valued at \$10,503,856. The oleomargarine went largely to the British West Indies, Germany, and the United Kingdom; the oleo-oil, for use in manufacture of oleomargarine, was taken by Holland (over 60 per cent.), Germany, Norway, Sweden, Denmark, the United Kingdom, and Belgium. Consult reports of the United States

Treasury Department, and Census Bulletin No. 138 (1902), on oleomargarine.

OLEOMETEER (from Lat. *oleum*, oil + Gk. *μετρον*, *metron*, measure), or **ELAÏOMETER**. An areometer used for ascertaining the densities of fixed oils.

OLEO-OIL. See **OLEOMARGARINE**.

OLÉRON, *ô'lâ'ron'*. An island on the west coast of France, belonging to the Department of Charente Inférieure (Map: France, E 6). It lies opposite the mouth of the river Charente, 10 miles north of the Gironde estuary, is 19 miles long, and has an area of 65 square miles. It is low, and for the greater part covered with sand dunes and salt lagoons, but some portions are well cultivated, producing grain, vegetables, and grapes. Salt is one of the chief products of the island, and ship-building is carried on at the harbor of Le Château, which has steamship communication with Rochefort and other coast towns. The population of the island in 1901 was 17,033. The principal town is Saint-Pierre-d'Oléron, with a population of 1338.

OLÉRON, **LAWs** OF, etc. A mediæval code of maritime laws promulgated and published some time during the twelfth century, by Eleanor, Duchess of Guienne (Aquitaine). These laws consisted of a collection of the judgments of the maritime court of Oléron, together with a compilation of the customs and usages of the sea having the force of law among the mariners of that island, which was a shipping centre. Some years after this codification was made and published in Oléron, Richard I., son of Eleanor, introduced the whole body of these laws into England. They were one of the sources of the maritime laws of Wisby, and were published in and had an important influence on the maritime laws of probably all the countries of Europe. The modern English and American maritime law has been developed from these laws as a basis, influenced by the Rhodian maritime laws, the laws of Wisby, the civil law, and the customs and usages of those engaged in shipping. See **ADMIRALTY LAW**; **MARITIME LAW**; **RHODES, LAW OF**; **WISBY, LAWs OF**. Consult the authorities referred to under **ADMIRALTY LAW**, and Twiss, *Monumenta Juridica. The Black Book of the Admiralty* (London, 1871).

OLEVIANUS, *ô'lâ-vê-â'nus*, **KASPAR** (1536-8). A German Church reformer. He was born in Treves and studied law in Paris, Orleans, and Bourges, where he became acquainted with the works of Calvin, of whom, after having continued his theological studies at Geneva, he became an ardent follower. In 1559 he obtained the post of teacher at a high school in Treves, and here he explained in popular lectures the principles of the Reformation. He thus came into collision with the archbishop of the diocese, who had him imprisoned. On the payment of a large sum he was released, but was expelled from the town together with his followers. At the invitation of the Elector Frederick III., Olevianus became teacher and in 1561 professor of theology in Heidelberg, where, in conjunction with Ursinus, he remodeled the Church of the electorate according to the principles of Calvin, and also worked out what is known as the 'Heidelberg Confession.' Upon the accession of Louis VI. Olevianus was deprived of his position and banished from the land. He

then took up his quarters in Berleburg, where he subsequently wrote his work on the covenant of grace, *De Substantia Fœderis Gratiuiti*. He was also successful in introducing the Reformed Church in Nassau-Siegen, Solms, Wied, and elsewhere. Consult Cuno, *Blätter der Erinnerung an Olevianus* (Barmen, 1887).

OL'GA, **SAINT** (?-989). A saint of the Russian Church. She was the wife of Prince Igor of Kiev, who, having undertaken an expedition against Constantinople, which proved unsuccessful, was slain on his return to his own dominions (945). His widow avenged his death, assumed the government in his stead, and governed with much prudence and success until her son Sviatoslav came of age (955), when she repaired to Constantinople, where she was baptized by the Patriarch Theophilaktos, and received into the Church, assuming at baptism the name of Helena, in honor of Saint Helena, mother of Constantine. She returned to Russia, and labored with much zeal for the propagation of her new creed. She is held in high veneration in the Russian Church. Her festival is on July 11th (24th), and the practice of venerating her appears to date from the early period of the Russian Church, before the schism between the Eastern and Western churches. Consult D'Elissalde Castremont, *Histoire de l'introduction du christianisme sur le continent russe, et la vie de Sainte Olga* (Paris, 1879).

OLIB'ANUM (ML. *olibanum*, probably from Ar. *al-lubân*, the incense, from *al*, the + *lubân*, incense, connected with Heb. *lebônâ*, incense, from *lûban*, to be white, Aramaic *lebânêthâ*, Syriac *lebontâ*, Phœnician *lebônât*, incense, whence Gk. *λίβανος*, *libanos*, Lat. *libanus*, frankincense). A gum resin that flows from incisions made in certain species of *Boswellia* (q.v.), growing in Northeastern Africa and on the southeastern coast of Arabia. It occurs in commerce in semi-transparent yellowish tears and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman and Greek Catholic churches. Large quantities of it are used in China. Practically all the olibanum of commerce passes through Aden.

OLIER, *ô'lyâ'*, **JEAN JACQUES** (1608-57). A French priest, founder and first head of the famous Seminary of Saint Sulpice in Paris, and of the congregation of that name. (See **SULPICIANS**.) He studied at the Sorbonne, and then entered into close relations with Saint Vincent de Paul, whose zeal for the conversion of souls he shared. He was ordained priest in 1633, and Cardinal Richelieu later offered him the bishopric of Châlons-sur-Marne, but he declined it, having already formed his plans for raising the spiritual and mental tone of the clergy by the foundation of a seminary. In 1642 he collected a few clerics about him at Vaugirard near Paris, and a few months later transferred his small community to Saint Sulpice, a parish in the Faubourg Saint-Germain which was in a very bad condition. Olier, however, instituted all manner of reforms and incentives to holiness, and by the aid of

zealous colleagues transformed the neighborhood. Having built a new church, he established his seminary in connection with it. In 1652, being in very poor health, he resigned his parochial charge and devoted himself altogether for the next five years to the upbuilding of the seminary and of the growing community of associates. He also founded seminaries at Montreal and several other places, as well as schools and institutions for the care of the poor and infirm. He died April 2, 1657. By far the best *Life* of him is that of Faillon (3 vols., Paris, 1873); an excellent English one, based upon it, is by Healy Thompson (London, 1885).

OLIGARCHY (Gk. *ὀλιγαρχία*, *oligarchia*, from *ὀλίγος*, *oligos*, few, little + *ἀρχεῖν*, *archein*, to rule). A form of government in which the supreme power is vested in a small class of persons. (See **ARISTOCRACY**.) It is a term applied by Greek political writers to that perversion of an aristocracy in which the rule of the dominant part of the community ceases to be the exponent of the general interests of the State, owing to the cessation of those substantial grounds of preëminence in which an aristocracy originated. The governing power in these circumstances becomes a faction, whose efforts are chiefly devoted to their own aggrandizement and the extension of their power and privileges.

OLIGOCENE EPOCH (from Gk. *ὀλίγος*, *oligos*, few, little + *καινός*, *kainos*, new). A subdivision of the Tertiary epoch, preceding the Miocene epoch. The term is seldom used in the United States for the reason that rocks of this age attain only limited development. The White River formation of Colorado comprising fresh-water strata is referred to this epoch, and there are smaller areas of contemporaneous beds in North Dakota and in the Northwest Territory of Canada. Oligocene strata cover wide areas in Central and Southern Europe. See **TERTIARY SYSTEM**.

OLIGOCHÆTA, *ol'gô-kê'tâ* (Neo-Lat., from Gk. *ὀλίγος*, *oligos*, few, little + *χάιτη*, *chai'tê*, mane). A suborder of chaetopod annelids, of which the common earthworm (q.v.) is a good example. The head is not well marked, and there are no tentacles or eyes. The locomotive appendages are in the form of simple bristles attached in rows to the sides and ventral surface of the body; there are no branchiæ or parapodia. All are hermaphrodite, and the young pass through no metamorphosis. The species are mostly fresh-water or terrestrial.

OLIGOCLASE (from Gk. *ὀλίγος*, *oligos*, few, little + *κλάσις*, *klasis*, fracture). A mineral sodium-calcium-aluminum silicate, intermediate between albite and anorthite, and belonging to the feldspar group. Its crystalline form is of the triclinic system, its color is generally white, though sometimes shaded with gray, green, or red tints, and it has a vitreous lustre. It occurs in the older rocks such as granite, and also in various eruptive rocks, such as andesite; it is found in Sweden, Finland, Germany, Switzerland, and in the United States at various localities in New Hampshire, Connecticut, New York, Pennsylvania, and North Carolina. Certain varieties of this mineral, especially those of a reddish color, show internal fire-like reflections that are due to finely disseminated crystals of iron

oxide, and when polished form the gems known as *sun stones*.

OLINDA, *ô-lên'dâ*. A town in the State of Pernambuco, Brazil, situated on the coast $4\frac{1}{2}$ miles north of Pernambuco, with which it is connected by a street railway (Map: Brazil, L 5). It was founded in 1535, being the first settlement and for a long time the most important commercial city of Northern Brazil. It was the capital of the Province of Pernambuco, and of the Dutch colony established there in the seventeenth century. The Dutch burned the town and made the neighboring Recife (now Pernambuco) the capital. Olinda long remained a favorite place of residence of wealthy Pernambucans, but it has now fallen into decay. Population, about 8000.

OLIPHANT, *ol'f-ant*, **LAURENCE** (1829-88). An English author and traveler, son of Sir Anthony Oliphant. He was born at Cape Town in 1829. Laurence Oliphant passed his early boyhood in England, but in 1841 he went to Ceylon, where his father was Chief Justice; traveled with his parents in Europe (1846-47); returned to Ceylon as private secretary to his father; practiced as criminal lawyer; went on a hunting excursion in Nepal; returned to England, and was called to the English and the Scotch bar. He was in Russia and the Crimea (1852); in Canada and the United States as secretary to Lord Elgin, Governor-General of Canada (1853-54); at Sebastopol, and served under Omar Pasha at the battle of Ingour (1855); at New Orleans, engaged in a filibustering expedition (1856); in China and Japan with Lord Elgin (1857-59); with Garibaldi in Italy (1860); envoy to the British legation in Japan, where he was dangerously wounded by assassins (1861); and afterwards he traveled in Egypt, Poland, and Palestine. He was elected to Parliament in 1865, but two years later he resigned to join the brotherhood founded by T. L. Harris (q.v.) at Brocton in western New York. He married in 1872, and his wife and mother joined the community. For years the Oliphants were the spiritual slaves of Harris; but they finally came to distrust him. After breaking with him, Oliphant settled for a time at Haifa in the Bay of Acre, where he devised schemes for restoring the Jews to the Holy Land. He died at Twickenham, near London, December 23, 1888. Oliphant served as special correspondent for the *Times* on various occasions and was a brilliant journalist. His many published books are mostly accounts of his travels. Among them are: *A Journey to Khatmandu* (1852); *The Russian Shores of the Black Sea* (1853); and *Earl of Elgin's Mission to China and Japan* (1859). His strange erratic character is boldly displayed in *Episodes in a Life of Adventure* (1887); his religious opinions in *Sympneumata* (1886); *Scientific Religion* (1888); and his novel *Massollam* (1886). What he might have been may be seen in his novel *Piccadilly* (*Blackwood's Magazine*, 1865), one of the most brilliant satires on English life ever written. With less success he worked the same vein in *Altiora Peto* (1883). Consult the *Memoir of Laurence Oliphant and His Wife, Alice Oliphant*, by Margaret Oliphant (Edinburgh, 1891).

OLIPHANT, **Mrs. MARGARET** (born Wilson) (1828-97). An English novelist and miscellaneous writer, born in Wallyford, near Mussel-

burgh, Midlothian, Scotland, April 4, 1828. In 1852 she married her cousin, Francis Oliphant, who died at Rome in 1859, leaving her penniless with three children to support. Already favorably known as a novelist, she could gain a livelihood with her pen, but the story of her efforts to rear her children and look after her helpless kinsfolk is a painful one. Her work during the next forty years, in spite of the speed with which it was done, is of a good quality, both in fiction and literary history. In 1864 she again went to Italy, and in 1890 she visited the Holy Land. From 1868 she received a civil list pension of £100. She died at Windsor, June 25, 1897. Her first novel, *Passages in the Life of Mrs. Margaret Maitland of Sunnyside* (1849), won instant attention and approval. Its most distinctive charm is the tender humor and insight which regulate its exquisite delineation of Scottish life and character at once on their higher and lower levels. It was followed by *Herkland* (1851); *Adam Graeme of Mossgray* (1852); *Henry Muir* (1853); *Magdalen Hepburn* (1854); *The Quiet Heart* (1854); *Zaidee* (1856); and several other novels, some of which originally appeared in *Blackwood's Magazine*. It was, however, by the *Chronicles of Carlingford* that Mrs. Oliphant's reputation as a novelist was first assured. In the first of them, *The Rector and the Doctor's Family* (1863), aside from its other merits, which are great, the character of Netty, the heroine, enlivens the whole work, and may rank as an original creation. The other, *Salem Chapel* (1863), perhaps indicates a wider and more vigorous grasp than is to be found in any other work of the authoress. Among succeeding novels are: *Three Brothers* (1870); *Squire Arden* (1871); *A Rose in June* (1874); *The Primrose Path* (1878); *Kirsten* (1890); *The Marriage of Elinor* (1892); and *A Widow's Tale* (1898). Other works are the *Life of Edward Irving* (1862); *Saint Francis of Assisi* (1868); *Memoir of the Comte de Montalembert* (1872); *The Makers of Florence* (1874); *The Literary History of England from 1790 to 1825* (1882); *The Makers of Venice* (1887); *Royal Edinburgh* (1890); *Life of Laurence Oliphant* (1891); *The Victorian Age of English Literature* (1892); *The Reign of Queen Anne* (1894); *The Makers of Modern Rome* (1895); and *William Blackwood and His Sons* (1897). Although most of these afford sober entertainment, none of them is deep enough to give Mrs. Oliphant the highest rank as a critic or as an historian. Consult the *Autobiography*, ed. by Coghill (New York, 1899).

OLIPHANT, THOMAS LAURENCE KINGTON (1831—). An English biographer and philologist. He was born near Bristol, was educated at Eton and Oxford, and studied in the Inner Temple. Besides his historical works, *The Emperor Frederick the Second* (1862), *The Jacobite Lords of Gask* (1870), and *The Duc de Luynes* (1875), he wrote excellent sketches of the historical development of English, among which the more important are: *The Sources of Standard English* (1873); *The Duke and the Scholar* (1875); *Old and Middle English* (1878; 2d ed. 1893); and *New English* (1886).

OLIVÁREZ, O'le-vá'râth, GÁSPARO DE GUZMAN, Count, Duke of San Lucar de Barrameda (1587-1645). Prime Minister of Philip

IV. of Spain. He was born at Rome, where his father was Ambassador. He received an excellent education at Salamanca, became the friend of Philip IV., his confidant in his amours, and (1621) his Prime Minister, in which capacity he exercised almost unlimited power for twenty-two years. Olivarez was able, and earnestly desirous of improving the condition of his country; but he yielded to the ambitions of Philip, which plunged Spain into the Thirty Years' War. The war for the subjugation of the Netherlands, which had been resumed in 1621, was waged without success. Resorting to any means to raise money, his oppressive measures caused insurrections in Catalonia and Naples, and roused the Portuguese to shake off the Spanish yoke in 1640. Repeated defeats encountered by Spain forced the King to dismiss Olivarez in 1643. He died at Toro.

OLIVE (Lat. *oliva*, from Gk. *ἐλαία*, *elaia*, olive). A plant of great economic value which has been in cultivation from prehistoric times, belonging to the genus *Olea*, of which there are some 30 species. The cultivated sorts originated from *Olea Europæa*. The nativity of the olive is accredited to Southern Europe and Asia Minor, and by some authorities to Syria. The tree is of great vitality, specimens being known which are said to be 1000 years old. It sometimes attains a height of 40 feet; has opposite, leathery, grayish-green smooth evergreen leaves, and drupaceous fruits which vary in color from waxen

OLIVE

yellow to black. The area for successful olive culture is restricted by its heat requirements more than by soil or moisture. It enjoys a dry climate, and will thrive on a thin soil and produce well if only the pomace is returned to the land from the oil press. Since this contains all the compounds derived from the soil, fertilization and cultivation increase the yield. The trees should be planted at least 33 feet apart each way, and if given the culture usually given prunes or plums will thrive well. The olive thrives best in dry climates like that of Syria and Assyria. It succeeds at the Cape of Good Hope, in Australia, and in California, where it was introduced at an early date by the Spanish missionaries, from which fact the variety most extensively cultivated in California has been called 'Mission.' Areas which were considered unfit for the industry have proved well suited to some of the early sorts lately imported from Spain and Italy, and the industry is an important factor in the horticultural resources of the State.

The tree is propagated either from twig-cuttings, sprouts or truncheons of old wood set in

moist ground, or from gnarled, woody buds that form near the base of the trunk. Such plants begin to bear when from seven to nine years old, and yield crops either annually or in alternate years, the crop reaching its maximum when the trees are about 30 years of age. The fruits are the chief commercial product of the olive. They are used for pickling, drying, and for oil production. In the Mediterranean countries this oil takes the place of butter and the animal fats used by other nations in culinary operations. The wood of the olive tree is very hard, possesses a beautiful grain and color, and is used for ornamental cabinet work. Among the Greeks the olive was sacred to Pallas Athene (Minerva), who was honored as the bestower of it; it was also the emblem of chastity. A crown of olive-twigs was the highest distinction of a citizen who had merited well of his country, and the highest prize of the victor in the Olympic games. An olive branch was also the symbol of peace; and the vanquished, who came to supplicate for peace, bore olive branches in their hands.

OLIVES, FOOD VALUE. Two food products of considerable importance are made from olives, viz. olive oil or salad oil, and pickled olives. A third product, little known in the United States, is the dried olive, much eaten in Greece and some other neighboring countries. Different varieties of olives vary greatly in size, ranging from less than 100 to over 400 to the pound, the majority, perhaps, ranging from 150 to 250 to the pound. The pit constitutes about 20 per cent. of the whole fruit, but here a considerable range is also found. Both pulp and pit contain oil. The amount of oil in the pulp in Californian olives ranges from 13 to about 88 per cent.; that in the pit from 0.36 to 1.52 per cent.

Whether used for oil-making or for pickling, the olive should be carefully gathered. The ripe fruit is used for oil-making and for pickling, the exact stage when it is best suited for this purpose being a matter which must be learned by experience. The green fruit used for pickling should be gathered when full grown and just before it begins to color and soften. The pickled olives usually found in the American market are made from the green fruit. The pickled ripe olives are also met with and may be recognized by their dark color.

The best oil is made by crushing the carefully picked fresh olives. To facilitate the extraction of the oil, the olives are often partially dried before crushing. In California old-fashioned stone mills are commonly used to crush the fruit, although bronze crushers are being tried with good results. The ground mass is pressed to extract the liquid portion, which contains watery plant juices in addition to the oil and more or less pulpy matter. Various devices are used to separate the oil and to purify it. It is said that the best oil is obtained by allowing the pulp, etc., to settle, and decanting the clear oil. It generally takes about one month for oil to settle the first time. Three rackings are usually sufficient. The oil thus obtained is almost as bright as can be produced by the most effective filtration, and it has, besides, the distinctive olive flavor and lacks the greasiness characteristic of all filtered oils. Great cleanliness must be observed in oil-making and every precaution taken to prevent rancidity.

In making pickles from ripe and green olives

essentially the same process is followed. The unpleasant acid and bitter flavor is removed by soaking the fruit in a solution of potash lye for a short time or by a longer soaking in water. In addition to removing the unpleasant flavor, the lye softens the skin of the fruit, so that the undesirable substances may be more readily extracted by water. Olives treated with lye must be soaked in clear water, which is frequently changed, to remove the potash. They are then placed in weak brine for a short time and afterwards in stronger brines. The details of each step of the process vary considerably, and much depends upon skill and experience. An abundant supply of pure water is of the first importance, and great care must be exercised to prevent the growth of molds, etc.

The uses of olive oil and olives as articles of diet are familiar. The former is used chiefly for dressing salads and for frying, the latter as a relish, for seasoning sauces, etc., and for garnishing various foods. The oil, like all fats, has a high fuel value, and on this its value as a food depends. The average percentage composition of pickled ripe olives follows: Water, 65.1; fat, 25.5; carbohydrates, 3.8; protein, ash, etc., 5.6; of pickled green olives, water, 78.4; fat, 12.9; carbohydrates, 1.8; protein, ash, etc., 6.9. It has been claimed that while the pickled green olive is chiefly valuable as a relish, the pickled ripe olive is really worthy of attention as a wholesome and fairly nutritious food. In Southern Europe and other regions the ripe olive is used as a staple article of diet.

OLIVE-BACKED THRUSH. See THRUSH.

OLIVENITE (from Ger. *Oliven-erz*, olive-ore, from *Olive*, olive). A hydrated mineral copper arsenate that crystallizes in the orthorhombic system. It has a vitreous lustre, and is of various shades of green to brown in color. The crystallized varieties are found in Cornwall, Devonshire, and Cumberland, England, in the Tyrol, and in the Ural district, while in the United States it occurs in the Tintic district of Utah, both crystallized and in the fibrous form, the last named being known as 'wood copper.'

OLIVENZA, ô'lê-vân'thâ. A town of Spain, in the Province of Badajoz, situated near the Portuguese frontier, 15 miles southwest of Badajoz (Map: Spain, B 3). It was formerly a garrison town, but its fortifications have been razed. The town manufactures leather, earthenware, and hats, and has steam flour mills. It was ceded to Spain by Portugal in 1801. Population, in 1900, 8933.

OLIVE OIL. A vegetable oil expressed from the fruit of *Olea Europea*, and in its purest state an inodorous, pale-yellow oil, with a specific gravity of .918 at 15° C. The olive oil of commerce differs greatly in quality. The seed yields about 32 per cent. of oil, of which 21 per cent. is furnished by the pericarp, and the remainder, which is much inferior, by the seed and woody matter of the fruit. In Sicily, where large quantities of olive oil are produced, the operation is performed in the following primitive fashion: The olives are first placed on a circular platform of masonry, about seven feet in diameter, upon which a heavy millstone is turned by means of a pole and donkey. The mass, which has been thoroughly pulped by this process, is now placed in soft rush baskets and put under a press which

is compressed by means of a wooden screw worked by five or six men. By this means the cold oil is expressed, heat being used to extract the remainder. The oil is allowed to settle and clarify for several days before it is ready for use.

Olive oil is used as a food or condiment, in pharmacy, as an illuminant and lubricant, and in the manufacture of soap. The olive oil of commerce is much adulterated, especially with cottonseed oil. The lowest grade is known as *tournant oil*. *Gallipoli oil* is made from the fruit after it has been allowed to ferment. It is chiefly used in dyeing. See OILS.

OLIVER, ANDREW (1706-74). A Lieutenant-Governor of Massachusetts. He was born in Boston, and graduated at Harvard in 1724. In 1743 he was elected to the Massachusetts General Court, in 1746 was chosen a member of the Council, and in 1756 became Secretary of the Colony. Upon the passage of the Stamp Act in 1765, he was appointed distributor for Massachusetts, and thus incurred the displeasure of the people. On August 14, 1765, he was hanged in effigy on the 'Liberty Tree,' and a mob destroyed a new building which, it was thought, was intended for his office. So great was his danger that a few days later he promised he would not receive the stamps. In the following December, upon a rumor that he still intended to serve, he was taken by a mob to the 'Liberty Tree' and there compelled to swear that such had never been his purpose. He continued, however, to uphold the cause of the Crown, and in 1770, on the promotion of his brother-in-law, Hutchinson, to the Governorship, Oliver was made Lieutenant-Governor in his stead. In 1773 certain letters written by Oliver in which he recommended changes in the Massachusetts charter and hinted at the desirability of taking off the 'principal incendiaries,' came into the hands of Benjamin Franklin, the agent of the colony in England; and these letters, together with some from Hutchinson and others, were published in Massachusetts and aroused such a storm of indignation against Hutchinson and Oliver that a petition was sent to England for their removal.

OLIVER, GRACE ATKINSON (1844-89). An American author, whose maiden name was Little. She was born in Boston, was educated in private schools there, and married J. H. Ellis in 1869. After his death (1871) she began to write for the press under his name, and her published works are *lives of Mrs. Barbauld* (1873), *Maria Edgeworth* (1882), and *Dean Stanley* (1885). She also edited the *Poems of Ann and Jane Taylor* and wrote their memoirs (1883). She married Dr. J. P. Oliver in 1879.

OLIVER, HENRY KEMBLE (1800-85). An American musician, born at Beverly, Mass. He graduated at Dartmouth College in 1818, and after teaching school for a number of years settled in Lawrence, Mass., of which city he became Mayor in 1859. From 1861 to 1865 he was Treasurer of the State of Massachusetts. He founded several musical societies, but was better known as the composer of the hymn-tunes, "Federal Street," "Morning," and "Beacon Street." He also composed motets, chants, and songs, and published: *The National Lyre* (1848); *Collection of Church Music* (1860); *Original Hymn Tunes* (1873).

OLIVER, JAMES EDWARD (1829-95). An American mathematician, born at Portland, Maine. He graduated at Harvard in 1849, and in 1850 was appointed assistant in the office of the newly established *Ephemeris and Nautical Almanac*, from which he resigned in 1867. After three years of research in chemistry and physics, he was chosen professor of mathematics in Cornell, where, in 1873, he became senior professor. He was an able teacher and with lectures and his own unsparing devotion to study seemed long on the point of ruining his health. He wrote *A Treatise on Trigonometry* (1886), and edited a series of mathematical text-books. As a mathematician he was reckoned by Peirce of Harvard the ablest in America.

OLIVER, PETER (1713-91). An American jurist, a brother of Andrew Oliver. He was born in Boston, and graduated at Harvard in 1730. After holding various minor offices, he was, in 1756, although not a lawyer, made a justice of the Superior Court of Massachusetts, and in 1771 was raised to the position of Chief Justice. Like his brother Andrew, he was a Loyalist, and in 1774 was the only one of the judges to refuse to decline the offer of a fixed salary from the King. Because of his refusal he was impeached by the House. He upheld the royal cause with considerable skill in *The Censor*, a Loyalist paper, and upon the evacuation of Boston by the British in 1776 he quitted the town with them. The remainder of his life was spent in England.

OLIVERS, THOMAS (1725-99). A Methodist preacher. He was born at Tregynon, Wales, received little schooling, and became a wandering cobbler. Being in Bristol, he went to hear Whitefield, was converted, and was made by John Wesley an itinerant preacher. In 1775 he became coeditor of *The Arminian Magazine*, but was removed in 1789 on the charge of carelessness. He died in London. His repute rests upon his hymns, one of which, "The God of Abraham praise," is deservedly famous. It is, however, not original, but a paraphrase from the Hebrew doxology of Daniel ben Judah, which summarizes the thirteen articles of the Hebrew creed. Consult the article on the hymn in Julian's *Dictionary of Hymnology* (London, 1892); and Rev. John Kirk's *Memoir of Olivers* (London, 1868).

OLIVER TWIST. A novel by Charles Dickens (1838). It appeared serially in *Bentley's Miscellany* between January, 1837, and March, 1839. It describes the evils of the workhouse, in which Oliver's childhood was passed, and the degraded and vicious life in London to which he was exposed during his apprenticeship to Fagin, the thief-trainer. Brutal Bill Sykes, Nancy, the Artful Dodger, and pompous Bumble, the parish beadle, are other leading characters.

OLIVES, MOUNT OF (also called Mount Olivet). The mountain east of Jerusalem, separated from the city by the Kidron Valley. It is, properly speaking, but one of a range of hills which starts out from the central highland about two miles north of Jerusalem. Just north of the city is the high elevation known in ancient times as Scopus, where the Roman army under Titus encamped. After a depression the range deflects and is continued southward for about two miles by the Mount of Olives. Farther

south (and southeast of Jerusalem) is a third hill, the Mount of Offense, where, according to tradition, Solomon erected altars for the heathen gods of his foreign wives (I. Kings xi. 7-8; II. Kings xxiii. 13). On the steep western slopes of the Mount of Offense lies the village of Siloam and in the valley between this mount and the Mount of Olives is one fork of the road to Jericho, on which lay Bethany, whence Jesus started on His triumphant entry into Jerusalem (Matt. xxi. 1 and parallels). The height of the Mount of Olives averages over 2000 feet, about 200 feet higher than the city. The name has come down from early times (cf. II. Sam. xv. 30), and there is thus reason to believe that it was once largely covered with olive trees. It was even called (II. Kings xxiii. 13) the Mount of Anointing, symbolical of the oil produced on it (cf. also Neh. viii. 15). During the siege by the Romans (A.D. 70) the trees were all cut down, and it has since been almost treeless.

As early as the days of David the mount appears to have had on it a sanctuary, perhaps originally instituted by the Canaanites and afterwards appropriated by the Israelites. From its commanding situation, east of the temple hill, as a great protecting wall before the city, the Mount of Olives was regarded with veneration by the Jews. It was called the Mountain of the Three Lights, since it was lighted up at night by the altar fire of the temple opposite, and by the first rays of the rising sun, and because it furnished the oil for the temple lamps. In prophecy (Zech. xiv. 4; Ezek. xi. 23) and in Rabbinic teaching it plays a rôle in the scenes of judgment connected with the Messianic era.

The mountain was the scene of several important incidents in Jesus' ministry. On its western slope, near the road leading down to the main eastern gate of the city, lay the Garden of Gethsemane, whither He often resorted for prayer, and where He was arrested. Somewhere on the same roadside He sat and discoursed to the disciples concerning the coming doom of the city opposite, and in His triumphal entry He passed down its slope on the same highway.

Christian tradition has altered and amplified the notices in the Bible by transferring the scene of the Ascension from near Bethany to the summit of Olivet (Luke xxiv. 50; cf. Acts i. 12), where two different spots claim the honor. One of these, an elevation directly east of the old temple site, is occupied by the Church of the Ascension, a small modern building, but on the ruins of a church built in the fourth century. It is in possession of Moslems, but Christians are permitted to use it on certain occasions. The rival spot is on a second eminence farther north, called Viri Galilæi (Acts i. 11), also (but wrongly) Scopos, now the property of the Greek Catholic Bishopric of Jerusalem and well cared for. On this hill extensive catacombs have been recently discovered, indicating that it was once a Jewish burial place, afterwards appropriated and enlarged by Christians. Near the Church of the Ascension is a wretched village, Kafr et-Tur. A little to the east on Russian property a fine observation tower has been erected. South of the Church of the Ascension are the possessions of the Latin Church, with the two chapels, that of the Creed, where the Apostles are said to have formulated the Apostles' Creed, and the Pater Noster, built by

a French princess in 1865. Deep down in the valley, just east of the bridge across the Kidron, is a chapel over the legendary site of the grave of Mary, mother of Jesus, whence her body was carried by the angels to heaven. Consult the works treating of the city of Jerusalem (see JERUSALEM); reports of the Palestine Exploration Fund, especially volumes for 1889 and 1896; and Baedeker, *Palestine and Syria* (Leipzig, 1898).

OLIVE-SHELL. A mollusk of the gastropod family, *Olividae*, which has a beautiful shell that resembles an olive in general shape. Many species, whose shells are brilliantly ornamented, inhabit the Indian Ocean and Australian seas. They occur at various depths down to fifty feet or so, and creep about the bottom, seizing and feeding upon small animals and carrion, from which they suck the juices.

BLACK OLIVE (*Olea Maura*).

OLIVE-SIDED FLYCATCHER. A migratory tyrant-flycatcher (*Contopus borealis*) of North America, which is slaty-brown above, with darker streaks, and olive-gray below, with the median line of the abdomen white. It frequents mountains and northern pine forests, and makes its nest on the branch of a pine or similar tree. The eggs are cream-colored, marked with reddish-brown and lavender spots. Few breed south of Canada, except in Northern New England. Consult Baird, Brewer, and Ridgway, *North American Birds*, vol. ii. (Boston, 1874). See Colored Plate of Eggs of SONG BIRDS.

OLIVÉTAN, *ô'lé-vá'tán'*, or **OLIVETANUS**, PIERRE ROBERT (?-1538). A French Reformed theologian, born at Noyon. He was a kinsman of Calvin and is credited with stimulating him to theological studies. Olivétan taught at Geneva for a year (1532-33), and was then banished to Neuchâtel. His great work was a version of the Bible, a basis for the work of subsequent scholars; it was published at Neuchâtel (1535) and at Geneva (1540). He was a painstaking, but not a great scholar.

OLIVET'ANS. A religious Order of the Roman Catholic Church, one of the many remarkable products of the great spiritual movement which characterized the twelfth and thirteenth centuries. The Olivetans, or Brethren of Our Lady of Mount Olivet, are an offshoot of the great Benedictine Order, and derive their origin from Giovanni de' Tolomei, a native of Siena, born in the year 1272. Tolomei had been a distinguished professor of philosophy in the university of his native city; but his career was suddenly interrupted by the loss of his sight. Although he was cured of his blindness (and, as he himself believed, miraculously), this visitation convinced him of the vanity of earthly things; and in company with some friends he withdrew to Monte Oliveto, near Accona, between

THE MOUNT OF OLIVES

Siena and Arezzo, where he devoted himself to prayer and religious exercises. After this he took the name of Bernard. By the direction of the Pope, John XXII., the new brethren adopted the Benedictine rule; but they chose as their especial province the cultivation of sacred science and the duty of teaching. In the year 1319 Tolomei was chosen as the first general; and even before his death, in 1348, the institute had made rapid progress, especially in Italy. It numbered at one time eighty-three houses, but at present the number is reduced to about a dozen, including one in Rome, which contains the grave of Saint Frances of Rome. The ancient mother house of Monte Oliveto and the beautiful cloister at Florence have been appropriated by the Italian Government, which uses the latter for barracks.

OLIVET COLLEGE. A coeducational institution at Olivet, Mich., established by a colony of citizens from Oberlin, Ohio, under the leadership of Rev. John J. Shepherd, the founder of Oberlin College. The school was opened in 1844, and continued as Olivet Institute until 1859, when a charter was obtained. The institution comprises collegiate and preparatory departments and a conservatory of music, with a total registration in 1902 of 260 and a faculty of 23. The library contained 28,000 volumes. The college has a campus of 15 acres, valued, with the buildings, at \$158,757, the value of all the college property being \$355,940, and its endowment \$150,000. The income for the year was \$55,120.

OLIVIA. (1) In Shakespeare's *Twelfth Night*, a countess sought by Duke Orsino. She falls in love with Viola, disguised as a page, and marries Viola's brother Sebastian, mistaking him for Viola. (2) In Wycherley's *Plain Dealer*, a hypocritical character loved by Manly. (3) In Goldsmith's *Good-Natured Man*, the daughter of Sir James Woodville. She is confined by her scheming guardian in a Paris convent, and is released by Croaker, whom she marries. (4) In Goldsmith's *Vicar of Wakefield*, the Vicar's elder daughter. She elopes with Squire Thornhill. (5) In Mrs. Cowley's *Bold Stroke for a Husband*, the daughter of Don Caesar, who by various pretenses drives away other suitors in order that she may marry Julio de Melessina.

OLIVIER, ô'l'vyá', JUSTE DANIEL (1807-76). A Swiss poet, born at Eysins (Vaud). He studied at the Academy of Lausanne, and afterwards taught literature there for several years. After the political troubles of 1845 he went to Paris and remained there until 1871, when he returned to Geneva, where he died. His poems include: *L'avenir* (1831); *Les chansons lointaines* (1847); *Dernières chansons*; *Théâtre de société fantaisies dramatiques* (1870); and some studies in natural history: *Le canton de Vaud* (1837-41); *Etudes d'histoire nationale* (1842); and *Mouvement intellectuel de la Suisse* (1845).

OLIVINE. See **CHRYSLITE**.

OLLA PODRIDA, ôl'ya pó-dré'na (Sp., putrid pot). Originally an accumulation of remains of flesh, vegetables, etc., thrown together into a pot, but generally employed to designate a favorite national dish of the Spaniards, consisting of a mixture of different kinds of meat and vegetables stewed together. It has also come

to be figuratively applied to literary productions of very miscellaneous contents.

OLLIER, ô'lyá', LÉOPOLD LOUIS XAVIER EDOUARD (1830—). A French physician, specialist in the pathology of the bones. He was born at Vans, Department of Ardèche; studied medicine at Lyons, and was professor of clinical surgery there, after several years as chief surgeon to the Hôtel Dieu (1860-77). He wrote: *Traité expérimental et clinique de la régénération des os* (1867); and *Traité des résections et des opérations conservatrices* (1885-90).

OLLIVIER, ô'l'vyá', EMILE (1825—). A French statesman. He was born at Marseilles, and studied there for the bar. Ledru-Rollin made him Commissary General at Marseilles in 1848, and Cavaignac appointed him Prefect of the Department of Bouches-du-Rhône the next year. He soon resumed his law practice, however, and was elected to the Legislative Assembly from Paris in 1857. As one of the 'Five' that constituted the opposition during the early Empire, he gained great reputation as an orator. Gradually he became a Conservative, and finally a Bonapartist. On January 2, 1870, Napoleon called him to be head of a constitutional Cabinet. Whether duped or bought, he became subservient to the Emperor, and lost the support of his fellow Ministers. He entered upon the German War 'with a light heart,' and after the first disasters, discredited, with all his colleagues, he retired, August 9, 1870. He became a member of the French Academy in 1870. He wrote: *Démocratie et liberté* (1867); *Lamartine* (1874); *L'église et l'état au concile du Vatican* (1879); *Thiers à l'Académie et dans l'histoire* (1879); *Nouveau manuel de droit ecclésiastique français* (1885); *Le concordat et le gallicanisme* (1885); *L'empire libéral* (1894-98).

OLMEDO, ôl-má'dó, JOSÉ JOAQUIN (1782-1847). A Spanish-American poet, born at Guayaquil, Ecuador. He was educated for the bar and practiced law in his native city. Afterwards he took a prominent part in politics, was a member of the Junta de Gobierno of Guayaquil (1820), the Constitutional Assembly of Peru (1823), Minister Plenipotentiary to London, Vice-President of Ecuador, and Governor of the Department of Guayas. He was one of the leaders in the revolution of 1845, but did not receive the expected election to the Presidency. His best known poem is an ode addressed to General Bolívar, as the deliverer of Peru. The works of Olmedo are very popular in South America, though his style is a little antiquated. They are to be found in Gutierrez, *América Poética* (1846); the *Poestas inéditas de Olmedo* (1861); and Herrera's *Apuntes biográficos de D. J. J. Olmedo* (Quito, 1887).

OLMSTED, ôm'stéd or òm', DENISON (1791-1859). An American physicist and astronomer, born at East Hartford, Conn. He graduated at Yale in 1813, was chosen professor of chemistry, mineralogy, and geology at the University of North Carolina in 1817, and in 1825 was called to Yale as professor of mathematics and natural philosophy. He published a number of works that had a wide circulation, among which were the *Student's Commonplace Books* (1828); *Introduction to Natural Philosophy* (1832); and *Introduction to Astronomy* (1839).

OLMSTED, FREDERICK LAW (1822-1903). A great American landscape architect. After special studies at Yale University (1845-46), he sought practical knowledge of agriculture by working on a farm in central New York and subsequently on Staten Island, contributing on rural subjects to technical periodicals. In 1850 he made a tour afoot in England and on the Continent for the study of landscape gardening and agricultural methods. His observations are found in *Walks and Talks of an American Farmer in England* (1852). He then went on a similar quest through the Southern and Southwestern States, studying also the effects of slavery on production, and embodying his experience in *A Journey in the Seaboard Slave States, with Remarks on Their Economy* (1856); in *A Journey Through Texas; or, a Saddle Trip on the Southwestern Frontier, with a Statistical Appendix* (1857); and in *A Journey in the Back Country* (1860). The three volumes were reissued as *The Cotton Kingdom* (2 vols., 1861), were much quoted in the controversies that arose out of the Civil War, and are still valuable as authorities. In 1856 Olmsted was made superintendent of the New York Central Park Commission, and a plan for this park, prepared by him and Calvert Vaux, was adopted in 1857. In 1861 he was appointed member of a commission of inquiry and advice on the sanitary condition of the United States troops. Of this commission he became general secretary and was active in Washington from 1861 to 1864, visiting also the armies in the field. Later he was prominent on the Southern Famine Relief Commission and in the organization of the New York State Charities Aid Association. In 1871 he presented to the Territorial Government of the District of Columbia the plans, since in large measure executed, for the 'parking system' of the streets of the capital. He helped also to found in New York the Metropolitan Museum of Art and the American Museum of Natural History. In 1872 he was made president of the Department of Public Parks in New York, and devised the plan, in large measure carried out, of the street system of New York north of the Harlem River, as well as for Riverside and Morningside parks in New York, Prospect and Washington parks in Brooklyn, Washington and Jackson parks in Chicago, and many others. He planned also the approach from Pennsylvania Avenue to the Capitol in Washington, was first commissioner of the Yosemite Park, and prominent in the Niagara Falls Reservation Committee, and in devising the system of parks and parkways in and around Boston. Important public works were conducted by him also in Bridgeport, Trenton, Montreal, Buffalo, Milwaukee, and Louisville.

OLMÜTZ, ol'müts. The second town of Moravia, Austria, situated on an islet of the river March, about 40 miles northeast of Brünn (Map: Austria, E 2). It was formerly strongly fortified, but its works have been converted since 1886 into promenades and parks. The chief square of the town is the Oberring, adorned with a column dating from 1742, and two fountains. Facing the Oberring is the town hall, with its astronomical clock, constructed in 1422, and an interesting chapel now serving as an historical museum. The cathedral is a Gothic edifice

of the fourteenth century, and the Church of Saint Mauritius, dating from the eleventh and twelfth centuries, is noted for its fine organ. Among the other interesting buildings may be mentioned the old Jesuit monastery, now used as barracks, the cloth hall, the buildings of the former university, and the archiepiscopal residence. Olmütz is well supplied with educational institutions. Besides the theological faculty (the remnant of the university founded in 1581 and abolished in 1855), there are two higher gymnasia, a higher *Realschule*, three training schools for teachers, a commercial school, an historical and an industrial museum, a library of about 75,000 volumes, with a considerable number of incunabula and manuscripts. The town has been the seat of an archbishop since 1777. The bishopric was founded in 1063, and the bishops held princely rank from 1588.

Olmütz has a number of breweries, manufactures of hardware, chemicals, and flour. The commerce in agricultural products is of some importance. Olmütz is mentioned as a town with a castle in 863. In 1063 it became the seat of a bishopric (changed to an archbishopric in 1777), whose incumbents later attained princely rank. Until 1640 the town was the capital of Moravia. In 1848 it was the scene of the abdication of Ferdinand I. in favor of Francis Joseph. Olmütz is noted for the conference held there in 1850 between the representatives of Austria, Prussia, and Russia for the adjustment of the difficulties which had arisen between Austria and Prussia as a result of the convulsions of 1848-49. In this conference the policy of Austria triumphed completely, and all hopes of a liberal Germany under Prussian leadership disappeared for the time. Population, in 1890, 19,761; in 1900, 21,933, mostly Roman Catholics, and over 50 per cent. German. Consult Müller, *Geschichte der königlichen Hauptstadt Olmütz* (Olmütz, 1895).

OLNEY. A city and the county-seat of Richland County, Ill., 118 miles east of Saint Louis; on the Baltimore and Ohio Southwestern, the Illinois Central, and other railroads (Map: Illinois, D 5). It is interested mainly in agriculture, and in exporting the fruit, hay, and seed of this region, and has flouring mills, brick and tile works, cold storage plant, and a creamery. There are a public library and a sanatorium. Olney, first settled in 1843, is governed by a mayor, biennially elected, and a unicameral council. The water-works are owned and operated by the municipality. Population, in 1890, 3831; in 1900, 4260.

OLNEY, JESSE (1798-1872). An American educator, born at Union, Tolland County, Conn. He taught in northern New York and in the Hartford Grammar School; was a member of the Connecticut Legislature for ten terms; and in 1867 was elected State Comptroller. Olney was one of the most prominent educators of his time and is especially well known for his reforms in the methods of teaching geography, which he began by studying the home of the pupil and sweeping outward in wider circles to township, county, State, and so on. He published: *A Geography and Atlas* (1828); *The National Preceptor* (1831); and many other text-books.

OLNEY, RICHARD (1835-). An American politician, born in Oxford, Mass. He graduated

at Brown University in 1856, studied law in Harvard Law School, was admitted to the Boston bar in 1859, and immediately became associated with Judge Benjamin F. Thomas, whose daughter he married in 1861. Olney rose rapidly in his profession, and was for many years chief counsel for the Eastern Railroad, and later for the Boston and Maine, as well as for other roads. Until 1893 he was not particularly active in public affairs, although he was a Democratic member of the Lower House of the Massachusetts Legislature in 1874, and was once an unsuccessful candidate for the office of State Attorney-General. In 1893 he was offered the place of Attorney-General of the United States by President Cleveland and accepted it. His most important act while occupying this office arose out of the great railroad riots of 1894. In June of that year he applied to the United States Circuit Court for the Northern District of Illinois for an injunction to prevent the strikers from interfering with the United States mails or with interstate commerce. The injunction was granted, it was enforced by United States troops, and the strike was broken. The action of the Circuit Court was later sustained by the Supreme Court, and as this was the first instance in which the power of injunction had been used for such a purpose, it furnished a precedent of the utmost importance. Upon the death of Gresham, in 1895, Olney became Secretary of State, and continued to hold that position until the end of Cleveland's Administration in 1897. In this period it fell to him to conduct the negotiations with England growing out of the disputed boundary between Venezuela and British Guiana, and his famous letter to Bayard, Minister to England, for the information of the English Government as to the American position in the matter, attracted great attention both in this country and in Europe. Previous to the Democratic Convention of 1896, Olney was much talked of as a possible candidate for the Presidency. Upon the nomination of Bryan and the adoption of the free-silver plank, Olney refused to support the Democratic ticket. In 1900, however, he advised the election of Bryan, and gave as his chief reason for so doing the imperialistic tendencies of the Republicans.

OLONETZ, ó-ló'nyéts. A northern government of Russia, bounded by the Government of Archangel on the north, by Vologda on the east, by Novgorod on the south, and by Finland on the west (Map: Russia, D 2). Area, about 57,500 square miles. The northwestern part belongs orographically and geologically to Finland. It is traversed in different directions by rocky ridges not exceeding 1000 feet in altitude, and separated from each other by lakes and marshes. The southeast part is flat, with the exception of the northern portion, which is somewhat elevated.

Many of the lakes and marshes contain iron ore, and the Devonian formations near Lake Onega yield marble and sandstone. There are also found some copper, clays, and mineral springs. Olonetz belongs to the basins of the Baltic and the White seas. Its chief rivers are the Svir; the Vytegra, which communicates with the Mariinsk Canal system; the Sunna, belonging to the basin of the Baltic; the Onega; and the Vyga, flowing into the White Sea. The number of lakes is estimated at over 2000, the largest of

them being the Onega (q.v.), Sego, Vigo, and Vadlo.

The climate is harsh and moist. The mean annual temperature varies from 34° to 37° F. The natural conditions are unfavorable for agriculture, and the local crops only partially suffice for domestic demands. Fishing is carried on extensively. Many of the inhabitants are engaged in lumbering. The manufacturing industries are insignificant, and mining is in a state of decline. Population, in 1897, 366,175, or less than seven inhabitants to a square mile. The population is composed chiefly of Great Russians, but there is also a perceptible admixture of Karelians (a race allied to the Finns) and Tchuds. Capital, Petrozavodsk.

OLORON-SAINTE-MARIE, ó'ló'rón' sánt' má'ré'. The capital of an arrondissement in the Department of Basses-Pyrénées, France, 15 miles southwest of Pau (Map: France, F 8). Its principal buildings are the eleventh-century Church of Saint Croix, and in the residential suburb of Sainte Marie, a Romanesque-Gothic cathedral also dating from the eleventh century. The town is in an agricultural region, and manufactures leather, flour, and woolens. It is the Roman Iluro; during the Reformation it was a stronghold of Catholicism. Population, in 1901, 9078.

OLOT, ó-lót'. A small town of Northeastern Spain, in the Province of Gerona, situated among the foothills of the Pyrenees (Map: Spain, G 1). It is the centre of an interesting volcanic region, and is surrounded by 14 volcanic cones. The lava in and around the town is perforated in many places by blowholes, through which continuous currents of cool air are expelled. Population, in 1900, 8017.

OLOZAGA, ó'ló-thé'gá, SALUSTIANO (1803-73). A Spanish politician, born at Logroño. He studied law, practiced in his native district, Logroño, and in 1831 conspired with other Liberals to assassinate King Ferdinand VII. He fled to France, but returned to Spain after the King's death, was elected to the Cortes, and became a leader of the followers of Queen Maria Christina. In reward for his services, the Queen sent him to Paris as Ambassador (1840). In 1843 he formed a Progressist Ministry, from which opposition on the part of the Cortes forced him to resign. He was threatened with a judicial inquiry into his actions, and again escaped to France, returning to Spain in 1846. Olozaga took a prominent part in the adoption of the Constitution of 1855; received his Ambassadorship in Paris again and held it for ten years, when he was ousted by O'Donnell's revolution. After the deposition of Isabella in 1868, for which Olozaga had striven, he was for the third time appointed French Ambassador.

ÖLS, or **OELS**, éls. The capital of a circle in the Province of Silesia, Prussia, and formerly capital of a principality on the Oelabach, 17 miles northeast of Breslau (Map: Prussia, G 3). Its castle, built in 1558, is the property of the Prussian Crown Prince. Among its churches are the Schlosskirche, from the twelfth century, and the Gothic Propstkirche, from the fourteenth century. There are manufactures of agricultural machinery, cloth, wagons, and shoes. Population, in 1900, 10,580. Oels was founded in the tenth century.

OLSHAUSEN, ôls'hou'zen, HERMANN (1796-1839). A German theologian. He was born at Oldesloe, in Holstein, entered the University of Kiel in 1814, and two years later went to the University of Berlin, where the teaching of Schleiermacher and Neander gave direction to his life studies and writings. In 1817 he was awarded the prize at the festival of the Reformation for an essay, *Melanchthons Charakteristik aus seinen Briefen dargestellt* (1818). This essay brought him to the notice of the Prussian Minister of Public Worship, and he was made privat-docent at Berlin in 1820, passing the next year to Königsberg as professor extraordinary, and in 1827 was elected full professor. He removed from Königsberg to Erlangen in 1834. His most notable work is his *Kommentar über sämtliche Schriften des Neuen Testaments* (4 vols., 1830; completed and revised by Ebrard and Wiesinger; Eng. trans., 1847-49). An earlier work adducing from the writings of the first two centuries historical proofs of the genuineness of the Gospels is *Die Echtheit der vier kanonischen Evangelien, aus der Geschichte der zwei ersten Jahrhunderte erwiesen* (1823). His method of exegesis is presented in *Ein Wort über tieferen Schriftsinn* (1824), and *Die biblische Schriftauslegung*. In these latter works he rejects the doctrine of verbal inspiration.

OLSHAUSEN, JUSTUS (1800-82). A German Orientalist, brother of the preceding, who made contributions to Semitic and Iranian philology. He was born at Hohenfelde; studied at Kiel, Berlin, and Paris (under De Sacy); and from 1830 to 1852 was professor at Kiel. Removed in the latter year by the Danish Government, which he had energetically opposed, he became professor at Königsberg (1853-58), then councillor in the Ministry of Education, and retired in 1874. Olshausen's more important works are: *Emendationen zum Alten Testament* (1826); *Fragments relatifs à la religion de Zoroastre* (1829), written in collaboration with Julius von Mohl (q.v.); *Die Pehlevi-Legenden auf den Münzen der letzten Sassaniden* (1843); *Lehrbuch der hebräischen Sprache* (1861); *Prüfung des Charakters der in den assyrischen Keilschriften enthaltenen semitischen Sprache* (1864). Consult Schrader, *Gedächtnisrede auf Justus Olshausen* (Berlin, 1883).

OLSHAUSEN, ROBERT (1835-). A German gynecologist, son of the Orientalist Justus Olshausen. He was born in Kiel, studied medicine there and at Königsberg, and taught at Halle (1862-77) and at Berlin. He is especially famed as an able operator; as the author of *Diseases of the Ovaries* (Eng. trans., 1887), and of *Klinische Beiträge zur Gynäkologie* (1884); and as the editor of the *Zeitschrift für Geburtshilfe und Gynäkologie*.

OLSHAUSEN, THEODOR (1802-69). A German author and politician, prominent in the Patriotic Party in Schleswig-Holstein, brother of Justus Olshausen. He was born at Glückstadt, studied law at Kiel and Jena, and, for his part in the demagogic disturbances, was forced to live in France and Switzerland until 1830. Then he settled in Kiel, and became an ardent advocate of the independence of the provinces. He was imprisoned in 1846 for his bold opposition, but his influence was all the stronger in the Revolution of 1848, and he became a member of the provisional Government, resigning to enter the Diet. In 1851

he was excluded from the amnesty, went to America, and lived in New York City and Saint Louis until 1865, when he returned to Hamburg. He wrote two popular works on America, *Geographisch-statistische Beschreibung der Vereinigten Staaten* (1853-55, incomplete), and *Geschichte der Mormonen* (1856).

ÖLSNITZ, ôls'nīts. A town in the Kingdom of Saxony, Germany, on the White Elster, 25 miles southwest of Zwickau (Map: Germany, E 3). The ancient Jakobskirche and a handsome Rathaus are the only buildings of note. The town has one of the largest carpet factories in Germany. Corsets, curtains, machinery, varnish, and dyes are also manufactured; and there is considerable trade, especially in cattle. Population, in 1900, 13,606.

OLSSON, ôl'son, OLOF (1841-1900). An American theologian and educator, born in Vermeland, Sweden. He studied at Upsala, became a Lutheran minister in 1863, and in 1869 came to the United States and received a charge in McPherson County, Kan. In 1891, Olsson left his congregation at Woodhull, Ill., to return to Augustana College, Rock Island, Ill., in which he had been professor (1877-88), and of which he now became president.

OLTEN, ôl'ten. A town of the Canton of Solothurn, Switzerland, 36 miles northeast of Bern, on the left bank of the Aar (Map: Switzerland, B 1). The town is an important railway junction, with railway shops, extensive shoe and felt factories, and wool and linen weaving, and is a noted tourist resort. Population, in 1900, 6969.

OLYMPIA (Lat., from Gk. Ὀλυμπία). The scene of the celebrated Olympic games, held every four years by the Greeks. It was situated in the Pisatis, the southeastern district of Elis, at the junction of the Cladeus with the Alpheus. It was never a town, but only a sanctuary with the buildings connected with the worship and the games. The central spot was the *Altis*, or sacred inclosure, an irregular quadrangle about 200 meters from east to west and 175 meters from north to south. On the west and south it was inclosed by a wall in Roman times, and at this period was somewhat enlarged, as there are traces of an earlier inner Greek wall. On the north was the hill of Cronos, the Prytaneion, and the row of *Treasures*; on the east the *Stadium*, to which a vaulted passage led, the *echo portico* opening into the *Altis* and southeast building, which seems to have been demolished to make room for a Roman house built for the Emperor Nero. Within the inclosure the chief structures were the temples of Zeus and Hera, the Metroön, the Pelopion, the Philippeion, and the great altars. The oldest place of worship seems to be marked by the remains of a great altar south of the Heræum, and evidently antedating that temple, as the earth and ashes containing very rude bronzes extended under the foundations. The *Heræum*, or Temple of Hera, was the oldest temple, and is probably the oldest Doric building known. It was a hexastyle peripteros with sixteen columns at the sides. The walls were of crude brick on a stone foundation and the colonnade was originally of wood, though these columns were gradually displaced by stone, a fact which has led to a great variety in the capitals. In the second century after Christ the building seems to have contained many

ancient relics and works of art, among them the venerable chest of Cypelus, covered with scenes from Greek legend in early Corinthian style, and the Hermes of Praxiteles, the great prize of the German excavations. In the southwestern part of the Altis was the great Temple of Zeus, erected by the Eleans about B.C. 460, and containing the colossal statue of the god in gold and ivory by the Athenian Phidias. The sculptures of the pediments and metopes, though the artists are unknown, and the very school is disputed, are valuable examples of Greek art just before its full development at Athens and Argos. The *Pelopion* was an irregular inclosure consecrated to Pelops. The *Philippeion* was a circular Ionic building, erected by Philip of Macedon after the battle of Chæronea, and containing statues of Philip, his parents, his wife Olympias, and his son Alexander, all by the Athenian Leochares. Besides the buildings, the whole inclosure was filled with statues of victors and votive offerings, conspicuous among which was the Nike of Peonius, on a triangular basis about 30 feet in height, erected by the Messenians and Naupactians shortly after B.C. 425. Outside of the Altis lay the *Palæstra*, or wrestling-school, and the great *Gymnasium* where all competitors were obliged to train for at least one month. After the suppression of the games (A.D. 394) the decline of Olympia was rapid. To provide a defense against the barbarian invaders, a fort was built in the Altis, of which the Temple of Zeus formed the northwest corner, while to provide material for the wall the other buildings were ruthlessly destroyed. Early in the sixth century of our era the Temple of Zeus seems to have been overthrown by earthquakes, and inundations of the Cladeus covered the plain with gravel. Though a scanty population still inhabited the place, the rivers frequently flooded it, and finally buried the whole field, in some places to a depth of twenty feet. Suggestions as to excavations were made by Montfaucon and Winckelmann, and in 1829 the French expedition to the Morea worked for a time at the Temple of Zeus and secured a few sculptures. The final excavation was due to Ernst Curtius, who aroused the interest of the Prussian Crown Prince (afterwards the Emperor Frederick) and secured the support of the German Government. From 1875 to 1881 the work was carried forward in a masterly fashion, and finally, at an expense of 800,000 marks, the entire Altis and a great part of the surrounding buildings were cleared. Preliminary reports were published yearly under the title *Die Ausgrabungen zu Olympia* (Berlin, 1876-82), but the authoritative publication is *Olympia, die Ergebnisse der von dem deutschen Reiche veranstalteten Ausgrabungen*, 5 vols. text and 4 vols. plates (Berlin, 1891-97). A popular account is Bötticher, *Olympia* (Berlin, 1882). Consult also: Flach, in Baumeister, *Denkmäler des klassischen Altertums*, s. v. Olympia (Munich, 1889); Gardner, *New Chapters in Greek History* (London, 1892); Diehl, *Excursions in Greece* (Eng. trans. London and New York, 1893). Ancient Olympia is described by Pausanias (Books v. and vi.), best consulted in the edition of Hitzig and Blümner (Leipzig, 1901), or the translation and full commentary of Frazer (London, 1898). An attempt at reconstruction is found in Laloux et Monceaux, *La restauration d'Olympie* (Paris, 1889).

OLYMPIA. A city, county-seat of Thurston County, Washington, and capital of the State, 65 miles southwest of Seattle; on the southernmost inlet of Puget Sound, at the mouth of the Deschutes River, and on the Northern Pacific Railroad (Map: Washington, C 2). The new State Capitol is a handsome structure, costing \$400,000, and among other prominent buildings are the county court house, Saint Peter's Hospital, McKenny Block, and the Capital National Bank building. The State Library contains 27,000 volumes. There are two bridges here, that across Budd Inlet being over 2000 feet in length. Olympia is a commercial centre of importance, the port for a considerable area rich in timber, agricultural, and mineral resources. The oyster industry is extensive, and much fruit is grown in the vicinity. The manufacturing interests are promoted by abundant water power, the river, with a succession of three falls, making a descent of more than 80 feet. Lumber is the chief manufactured product, but the city has also iron works, a brewery, a salmon cannery, etc. Settled in 1846, Olympia was laid out in 1851 and was chartered as a city in 1859. Population, in 1890, 4698; in 1900, 3863.

OLYMPIAD (from Gk. *Ὀλυμπιάς*, *olympias*, from *Ὀλυμπία*, *Olympia*, Olympia). The period of four years that elapsed between two successive celebrations of the Olympic games (q.v.). The use of Olympiads as a convenient system of chronological reckoning among the Greeks was of comparatively late date. Timæus (c.300 B.C.) seems to have been among the first to date events by Olympiads, and after him the addition of the separate years in the period was introduced. The name of the winner of the foot-race in the games was frequently used with or instead of the number of the Olympiad. The first Olympiad, or that of Coræbus, corresponds with B.C. 776. As the Olympic games did not coincide with the beginning of any calendar year in use among the Greeks, most of the writers call the Attic or Macedonian or some other year in which the games fell the first year of the Olympiad, though even here there are many variations, and the usage of each author must be determined separately. This system is confined to literature, and never appears on coins and only very rarely in late inscriptions. It is sometimes used now by historians in dating Greek events, though commonly the year according to our era is added. The ordinary rule for changing Olympiads to years before or after Christ is as follows: Multiply one less than the number of the Olympiad by 4, add the number of the year in the Olympiad, and subtract this from 777 for dates before Christ, or subtract 776 for dates after Christ. Thus Ol. 81.3 is reduced $(80 \times 4) + 3 = 323$; $777 - 323 =$ B.C. 454; Ol. 218.2 is reduced $(217 \times 4) + 2 = 870$; $870 - 776 =$ A.D. 94. Simpler is Unger's rule: to find the first year of any Olympiad multiply the number of the Olympiad by 4 and either subtract from 780 or subtract 779, as the case requires. It should be noted that if the date is from an author who reckons by Attic years allowance must be made for the fact that such years begin about July 1st, so that dates in the spring are in an earlier Julian year than those in the autumn.

OLYMPIAS (Lat., from Gk. *Ὀλυμπιάς*). The wife of Philip II., King of Macedonia, daughter of

Neoptolemus I., King of Epirus, and mother of Alexander the Great. She was married to Philip in B.C. 359. When Philip, after neglecting her, separated from her and married Cleopatra, niece of Attalus (B.C. 337), she withdrew from Macedonia and went to reside with her brother Alexander, King of Epirus. It is generally believed that she was implicated to a greater or less degree in the assassination of Philip (B.C. 336). After Philip's death she returned to Macedonia, where she enjoyed great influence under Alexander and helped to bring about the death of Cleopatra and her infant daughter. After the death of Alexander (B.C. 323) she again withdrew from Macedonia to Epirus, where she stayed several years, until the death, in B.C. 319, of Antipater, who had been at the head of affairs in Macedonia, brought her a new opportunity to assert her pretensions to the Macedonian throne. Joining forces with the new regent, Polysperchon, she invaded Macedonia and in B.C. 317 defeated Arrhidaeus, the weak-minded stepbrother and successor of Alexander, and his wife, Eurydice, both of whom she caused to be put to death. Being now in power, she followed up her vengeance and executed wholesale slaughter on the Macedonian nobles who had shown themselves hostile to her. Thereupon Cassander (q.v.), her principal adversary, who had previously been in alliance with Eurydice and whose brother Nicanor was one of those put to death by Olympias, marched northward from the Peloponnesus, forced her to take refuge in Pydna, and there besieged her throughout the winter. In the spring of B.C. 316 she was at length compelled to surrender, and was immediately after put to death. Olympias was a woman of fierce and ungovernable passions, jealous, ambitious, and cruel, but having withal something of the spirit and impetuosity of her son Alexander.

OLYMPIC GAMES. The most famous of the four great national festivals of the Greeks. They were celebrated in the sanctuary of Zeus at Olympia (q.v.) every four years, but, owing to the fluctuations of the Greek lunar calendar, the time varied from the beginning of August to the middle of September. At first the contests only occupied a single day, but in later times five or six days were needed to complete the sports. The origin of the games was lost in antiquity, and legend attributed the foundation to Hercules, Pelops, who was worshiped with special honor as a hero at Olympia, and other mythical characters. They were said to have fallen into neglect until King Iphitus of Elis and Lycurgus of Sparta established the 'truce of God' at the celebration of the games and restored them to honor. It was not till much later, however, that the official list of victors began with Coræbus, who won the foot-race in B.C. 776. The authority of the list, however, is small for any period before the fifth century, as it does not seem to have been compiled before that time, and there are many indications that it was not based on ancient records. According to the accepted belief, the earliest and for long the only contest was the *stadion* or short foot-race. In Olympiad 14 (B.C. 724) the *diaulos*, or race of two *stadia*, was introduced, and at the next celebration the *dolichos*, or long run. In the same year the contestants abandoned the loin cloth and appeared naked, a

custom which prevailed ever after. In B.C. 708 the *pentathlon* and wrestling were introduced, in B.C. 688 boxing, and in B.C. 680 the race for four-horse chariots, to which were added in B.C. 648 the race for ridden horses, and the *pancratium*, a combination of boxing and wrestling. In B.C. 632 contests for boys were established, which from B.C. 616 consisted of running, wrestling, and boxing. In B.C. 520 the foot-race for men in armor was added, and in the fourth and third centuries other novelties, especially in horse-racing, were from time to time attempted. From B.C. 396 there was a contest of trumpeters and heralds, and the successful competitor in the latter was allowed to show his skill in announcing the victors in the other contests. During the greater part of their existence the games were in charge of the Eleans, though the city of Pisa, in whose ancient territory Olympia was situated, frequently disputed this right, until early in the sixth century Pisa was destroyed by Elis and Sparta. The chief officials were the *Hellenodikai*, whose number varied from one or two to twelve, though the usual number seems to have been ten. Early in the year of the games envoys from Elis were sent throughout the Greek world to invite the States to join in honor to Olympian Zeus, but at first the games seem to have had merely a local character, though they soon became a national festival. To them the States sent *Theoriae*, sacred embassies, to bring their offerings and vie with one another in the splendor of their equipment and entertainment. The crowd of spectators included representatives of all branches of the Greek race, and many barbarians were drawn by the reputation of the spectacle. Merchants and traders were there in abundance, while poets, orators, and artists exhibited their powers to a gathering which could easily secure a world-wide fame to a successful display.

The competitions were open only to those of Greek descent, and free from taint of impiety, blood-guiltiness, or grave breach of the laws. All contestants were required to train faithfully for ten months before the games, while the last thirty days must be spent at Elis under the eyes of the officials, though it is possible that this was only required of novices. Just before the games the list of entries was prepared, and from that time withdrawal was punished with heavy fines. The order of the events is uncertain, and possibly varied at different times, but the first athletic contest was almost certainly the *stadion*, and the name of this victor served to designate the Olympiad. The first day of the festival was given to sacrifices, especially to Zeus, while the officials and contestants took a solemn oath, the former to judge fairly, the latter that they had observed the prescribed training and would compete with fairness. The second day probably began with the foot-races, and for these the crowd gathered in the *Stadion*, an oblong plain inclosed by sloping banks of earth. The course was marked at both ends by a marble sill, about 80 feet long and 18 inches wide, in which were two grooves to give a foothold in starting. The finish was always at one end, but the starting point varied for the single and double courses. The length of the course was 600 Olympic feet of 0.32045 meter, or about 630 English feet. In the long run the double course seems to have

been covered twelve times. Another group of contests was formed by wrestling, boxing, and the pancratium. In the first, the object was to throw the antagonist three times, but the struggle was not continued on the ground. Boxing became more and more brutal, for while at first the pugilists wound straps of soft leather over the fingers as a shield and to deaden the blows, in later times hard leather, sometimes even weighted with metal, was used. Still the highest praise was won by athletes who owed their success to such perfect defense that they exhausted their opponents without striking a blow or receiving a scratch. In the pancratium, the most severe of the sports, both wrestling and boxing were employed, and the contest continued until one of the contestants acknowledged his defeat. For these contests the competitors were paired by lot, and it was regarded especially creditable to pass through the successive rounds without the rest afforded by drawing a bye, which might occur whenever the number of contestants was uneven. The horse-races were run in the Hippodrome (q.v.), of which no traces have been discovered, but which is said to have had a length of four stadia. As this would mean that a complete circuit was nearly a mile, and as we are told that the four-horse chariots made twelve circuits, it follows that the race must have been far more a test of endurance than of speed, or else, which is more probable, that these figures have suffered in transmission. This sport was naturally confined to the wealthy, but was very popular, and the successful owner received high honor in his State, while princes commemorated their victories on their coins. After the horse-racing came the *pentathlon*, or five-fold competition in running, jumping, throwing the javelin and the discus, and wrestling. The exact order of the competition and the method of determining the winner are unknown, but it is clear that it was necessary to show decided all-round ability. The running was the short race, or Stadion, and the jumping was for distance, not height, but was probably analogous to the modern hop, step, and jump, for the ground was softened to a distance of 50 feet, and we hear of two men who cleared 52 and 55 feet, respectively. The javelin was a light spear, and was thrown with the aid of a strap which was wrapped about the shaft, by which a rotary motion and greater distance and accuracy was secured. The discus was a plate of bronze, probably lens-shaped, and much heavier than the one now in use in athletic games ($4\frac{1}{2}$ pounds), as the best throw recorded is 95 Olympic feet. The last event of the games seems to have been the race in armor, twice the length of the Stadion. At first the runners wore the full armor of a hoplite, but later they carried only the shield. On the last day of the festival the victors received in front of the temple the crowns of wild olive from the sacred tree, which were the only prize, and afterwards were banqueted by the State of Elis at the Prytaneion. The victor returned home in triumph to enter the city in a chariot, often through a breach in the walls, with songs and processions. His praises were sung by poets, and in many cities he lived thereafter at public expense.

The games were at their height during the fifth and fourth centuries, when the contestants

were of the best blood in Greece. Gradually, however, a change took place, as the training became more and more a profession, and in Roman times, although the crowds and the splendor continued, the competitors were nearly all the professional athletes against whose mode of life physicians and moralists alike directed their censure. Yet the games continued until A.D. 394, when they were finally suppressed by the Emperor Theodosius, supposedly on the ground that they were opposed to the interests of Christianity.

MODERN OLYMPIC GAMES. Largely owing to the efforts of the Baron Pierre de Coubertin, a number of individuals banded themselves together and organized an International Athletic Committee, which held its first meeting in Paris in 1895. The object of the committee was to reestablish the Olympian games by organizing a series of athletic contests to be held once in every four years, and to take place at such time and in such country as the International Committee might decide. The first games in the modern series were held at Athens in 1896, the ancient Stadium, which had been specially prepared for the purpose, serving as the theatre. The patriotic munificence of a wealthy Greek of Alexandria (George Abéroff), together with the efforts of the Greek national committee, under the Crown Prince Constantine, alone made this possible. The different competitions were for the most part open to the world. The second and more important festival was held at Paris in 1900, the games being divided into ten sections, as follows: Athletic sports and games; gymnastics; fencing; shooting; equestrian sports; cycling sports; motor car racing; aquatic sports; firemen's drill; and ballooning. A conspicuous feature was the large number of American entries, to secure which the authorities had purposely delayed the date of the games. It was announced that the 1904 games would be held in the United States. Consult: Krause, *Olympia, oder Darstellung der olympischen Spiele* (Vienna, 1838), which is still of value; Bötticher, *Olympia; Das Fest und seine Stätte* (2d ed., Berlin, 1886); Mommsen, *Ueber die Zeit der Olympien* (Leipzig, 1891); Stengel "Die griechischen Kultusaltertümer," in Müller's *Handbuch der klassischen Altertumswissenschaft* (Munich, 1898); Gardner, *New Chapters in Greek History* (London, 1892).

OLYMPIODORUS (Lat., from Gk. Ὀλυμπιόδωρος, *Olympiódōros*). (1) An historian of the fifth century A.D., born at Thebes in Egypt, who continued the work of Eunapius. In his history (*Ἱστορικὸν Λόγιον*), in twenty-two books, he covered the period A.D. 407-425. Only a fragment has been preserved to us by Photius.

(2) An Alexandrian philosopher of the fifth century A.D., famous for his knowledge of Aristotelianism and as the master of Proclus.

(3) One of the latest of the Alexandrian Neo-Platonists who lived in the sixth century A.D., during the reign of the Emperor Justinian. Of the details of his life we know nothing. Of his writings we possess a life of Plato with commentaries on several of the Platonic dialogues. In these he shows himself to have been a man of large learning and of acute thought. His *Life of Plato* is best edited by Westermann

(Berlin, 1850). The scholia are edited by Fincke (Heilbronn, 1847).

(4) An Alexandrian Peripatetic who flourished in the latter half of the sixth century A.D. His commentary on Aristotle's *Meteorology* is still extant, edited by Stüve (Berlin, 1900).

OLYMPUS (Lat., from Gk. Ὀλυμπος, *Olympos*). The ancient name of several mountains or chains of mountains—e.g. one in Northeastern Mysia, two peaks in the island of Cyprus, others in Lycia, Lydia, Cilicia, Lesbos, Elis, another in Laconia, commonly called Lycaon, and, most famous of all, one on the boundary between Thessaly and Macedonia. The last is the highest peak (9754 feet) and greatest mountain mass in Greece, and early appears as the seat of the gods. The mountain is precipitous and rugged, especially toward the sea, but on the lower slopes is well wooded, though the upper part is bare rock, which is snow-covered during a large part of the year. Even in the Homeric poems is found a transference of the Olympus of the gods from the actual summit of the Thessalian mountain to a heavenly region free from snow and storm, and filled with dazzling light. It lies above the heaven, though in later usage it seems often indistinguishable from it. This begins in *Æschylus* and *Pindar*, and characterizes the later poets, except when they are copying Homer. Traces of the old belief are still found among the peasants who live at Olympus, and who tell of strange palaces on the mountain, or magic virtues in its air. Consult Henzey, *Le Mont Olympe et l'Acarnanie* (Paris, 1860).

OLYNTIAC ORATIONS. Three speeches of Demosthenes in warm support of the citizens of Olynthus who besought Athens for aid when Philip laid siege to the city. The orations were delivered in Athens in B.C. 349.

OLYNTHUS (Lat., from Gk. Ὀlynθος, *Olynthos*). A Greek city in Chalcidice (q.v.), at the northern end of the Toronaic Gulf. It was one of the numerous colonies sent out there by the Chalcidians and Eretrians of Eubœa. In the autumn of B.C. 480 it was sacked by Artabazus, the Persian general who had accompanied Xerxes in his retreat. Reestablished by Chalcidians of Torone, it first became prominent as the head of the Chalcidians in their revolt from Athens (B.C. 432). The inhabitants of neighboring villages gathered within its walls, and when Brasidas appeared the town supported him heartily. During the Peloponnesian War and the early part of the fourth century the region was little disturbed, and Olynthus became the head of a confederacy, which can almost be called a federal State. Treaties and wars with the Macedonians resulted in such an increase of power that Apollonia and Acanthus, which the Olynthians wished to force into the league, and Amyntas of Macedon appealed to Sparta for support. A powerful Spartan force invaded the Chalcidian Peninsula, and after some reverses the city was forced to surrender (379), and the confederacy was broken up. Olynthus still remained powerful, but the chief check to the growth of Macedon was removed. Philip, son of Amyntas, at first won the friendship of Olynthus by the gift of Potidæa, which he had taken from Athens, but later hostility arose, and the Olynthians sought an alliance with Athens. Though Demosthenes in his three famous Olynthiacs urged prompt and energetic

action, the Athenian succors were inadequate and tardy. In 348 Philip, aided by traitors within, seized the city, leveled it to the ground, and sold the inhabitants into slavery.

OLYPHANT, ɔl'f-ant. A borough in Lackawanna County, Pa., five miles northeast of Scranton; on the Lackawanna River, and on the Delaware and Hudson and the New York, Ontario and Western railroads (Map: Pennsylvania, F 2). It is engaged extensively in mining and shipping coal, being in the heart of the anthracite region of the State, and in manufacturing blasting powder. Settled in 1857 and incorporated twenty years later, Olyphant is governed by a burgess, elected every three years, and a borough council. The electric light plant is owned by the municipality. Population, in 1890, 4083; in 1900, 6180.

OM, ɔm. A Sanskrit sacred syllable, to which especial sanctity and mystic significance is attached. It seems originally to have been an exclamation, an emphatic assent, or solemn affirmation, and instances of its use in that way may be cited early in connection with Vedic literature. Perhaps it was primarily nothing more than an emphatic *o* with gradual lip-closure ending in a nasal murmur. According to Manu, the syllable must be uttered at the beginning of every Vedic recitation and pronounced again at its close; otherwise the sacred knowledge and its merit will slip away, be lost, or prove of no avail. Indian tradition plainly looks upon the word *om* as a composite of three elements (*a-u-m*), and as containing the very essence of the three canonical Vedas, and especially in later times *om* was regarded as the equivalent or mystic designation of the Hindu Trinity, symbolizing in a word the union of the three great divinities, Vishnu, Siva, and Brahma. See also OM MANI PADME HUM.

OMAGH, ɔ-mă' (Ir. *Oigh magh*, Seat of the chiefs). The capital of Tyrone County, Ireland, on the Strule, 34 miles south of Londonderry (Map: Ireland, D 2). Its public buildings include a handsome court house, where the county assizes are held, endowed and national schools, a district lunatic asylum, a workhouse, and a barrack station. Its trade is chiefly in brown linens, corn, and agricultural produce. Omagh grew up around an abbey founded in the year 792, but is first heard of as a fortress of Art O'Nial at the end of the fifteenth century, about which time it was forced to surrender to the English. Population, in 1901, 4789.

OMAGUA, ɔ-mă'gwă, or CAMBEVA. A famous and powerful tribe of Tupian stock (q.v.), formerly centring chiefly about the Marañon (Amazon) from the Javary to the Ica, on the Peru-Brazil frontier, but now mostly retired to the headwaters of the Yapura and Uaupes, South-eastern Colombia. Both names signify 'Flat-heads,' in allusion to a custom practiced in the tribe. At the time of the Spanish conquest the Omagua were reputed to be the richest and most civilized tribe east of the Cordilleras, with cities, temples, and stores of golden treasure. Three successive attempts were made to conquer their country in 1536, 1541, and 1560, but in each case the invaders were driven back with loss. In 1645 the Jesuit missionary Cujia entered their territory, and after several years of hard work succeeded in gathering them into

villages along the Amazon. Forty years later these mission villages numbered forty, all in flourishing condition, and continued to prosper in spite of attacks by Portuguese slave-hunters, until the expulsion of the Jesuits from the Spanish colonies in 1767. The mission settlements were gradually broken up, and the Indians retired to the forests and relapsed into their original condition.

They still maintain their reputation as a superior tribe, being of fine physique and light complexion, intelligent, industrious, honest, kindly, and cleanly in house and person. They bury their dead in large earthen jars beneath the floors of their huts, the relatives wailing constantly for a month after the funeral. Young men are subjected to a whipping ordeal to try their fortitude, while girls are hung up in a net over a smoldering fire. They have long since abandoned the practice of head-flattening. Our knowledge of caoutchouc or india-rubber was derived first from this tribe.

OMAHA, *ŏ'mā-hg*. An important Siouan tribe, formerly claiming an extensive territory on the west side of the Missouri, between the Platte and Niobrara, within the present limits of Nebraska, and now gathered, together with the Winnebago, upon a reservation in the north-eastern part of that State. The name signifies 'upper-stream' people, in distinction from the Quapaw, or 'down-stream' people. They speak a dialect of the same language used also by the Ponca, Quapaw, Kaw, and Osage, from whom, according to their tradition, they separated at no very distant period. They made a treaty of peace and alliance with the Pawnee in 1800, but were constantly at war with the Sioux, from whom they repeatedly suffered until the United States Government interfered and put a stop to hostilities. In spite of war and smallpox, they have held their own in population, and number now about 1200, being slightly on the increase, while the Winnebago, on the contrary, are decreasing. Their agent reports them as prosperous and steadily improving in industry and civilized habit. The majority still occupy the circular long house, covered with earth, formerly common to the semi-sedentary tribes of the Upper Missouri region.

OMAHA. The largest city of Nebraska and the county-seat of Douglas County, 492 miles west by south of Chicago, Ill.; on the Missouri River, opposite Council Bluffs, Iowa, and on the Burlington Route, the Chicago, Milwaukee and Saint Paul, the Chicago, Rock Island and Pacific, the Chicago, Saint Paul, Minneapolis and Omaha, the Fremont, Elkhorn and Missouri Valley, the Chicago and Northwestern, the Illinois Central, the Missouri Pacific, and the Union Pacific railroads (Map: Nebraska, J 2). The great bridges across the Missouri are among the sights of the city. These unite it, through Council Bluffs on the east side, with a great radiating system of railways to all points eastward. A belt line encircles the city, affording railway intercommunication.

Omaha is finely situated on a plateau, rising into bluffs which are largely used for residence sites, the business district lying adjacent to the river. From its important position, with reference to the West, it has been called the 'Gate City.' It occupies an area of $24\frac{1}{2}$ square miles

at an elevation of about 1030 feet above sea level, and 80 feet above the river, and has broad streets, of which 85 miles are paved. The public park system, nearly 600 acres in extent, includes the more notable Hanscom, Riverview, Bemis, Miller, and Elmwood parks, and Jefferson Square. Omaha is the seat of Creighton University (Roman Catholic), founded in 1879, a Presbyterian Theological Seminary, Creighton Medical College, Omaha Medical College, Nebraska College of Pharmacy, Brownell Hall, Academy of the Sacred Heart, and Saint Catherine's Academy, and has several libraries. The Public Library contains more than 55,000 volumes, and is located in one of the prominent buildings of the city. Other architectural features are the city hall, county court house, United States Government Building, high school, New York Life Insurance Building, office of the *Omaha Bee*, Paxton Block, the Exposition Building, the Coliseum (a large convention hall), and Protestant Episcopal and Roman Catholic cathedrals. The State School for the Deaf is in the city, and there are also several well-equipped hospitals, among which particular mention may be made of Saint Joseph's, Presbyterian, Methodist, and Immanuel (Swedish) hospitals. Omaha is the seat of the United States military headquarters of the Department of the Platte. The city has extensive shops of the Union Pacific Railroad, and one of the most complete establishments in the country for smelting and refining the ores of gold, silver, copper, lead, and zinc which come from the mining regions along the line of the Union Pacific and other railways. The meat-packing industry, represented by five separate plants located in South Omaha (q.v.), has assumed an extent excelled only by Chicago and Kansas City. Other manufactures include linseed oil, white lead, carriages, malt and distilled liquors, boilers and steam-engines, and bricks. The trade in live stock, grain, lumber, dry goods, and groceries is enormous, due to the city's excellent facilities for transportation.

The government is vested in a mayor, chosen every three years; a unicameral council; and in subordinate administrative officials, appointed by the executive with the consent of the council. The board of education, composed of 15 members, is independently elected by popular vote. Omaha spends annually, in maintenance and operation, nearly \$1,500,000, the principal items being about \$375,000 for schools, \$295,000 for interest on debt, \$120,000 for the fire department, \$80,000 for the police department, and \$80,000 for municipal lighting. The city carries (1901) a bonded debt of over \$5,600,000. Population, in 1860, 1883; in 1870, 16,083; in 1880, 30,518; in 1890, 140,452; in 1900, 102,555, including 23,600 persons of foreign birth and 3400 of negro descent.

In 1804 Lewis and Clark held a council with the Indians on or near the present site of Omaha, and in 1825 J. B. Royce, a fur-trader, built here a stockade and trading station, which, however, soon fell into decay. The first permanent settlement was made in 1854, and from that date to 1867 Omaha (so called from the Omaha Indians, a tribe of the Dakotas) was the capital of Nebraska. It was incorporated as a city in 1857. The growth of Omaha was greatly accelerated by the construction of the Union

Pacific Railroad, work on which was begun here in 1864. Previous to its completion Omaha was the most northerly outfitting place for overland wagon trains to the 'far West.' From June 1 to November 1, 1898, the great Trans-Mississippi and International Exposition was held here. Consult: Savage and Bell, *History of the City of Omaha* (New York, 1894); Sorensen, *Early History of Omaha* (Omaha, 1876); Powell, *Historical Towns of the Western States* (New York, 1901).

O'MAHONY, ô-mă'ô-nê, JOHN FRANCIS (1816-77). An Irish politician, born at Kilbeheny, County Limerick. He received a good education at a classical school in Cork and at Trinity College, Dublin, though he never took a degree. Early in his career he became deeply impressed with a sense of the wrongs of Ireland, and practically his whole life was devoted to efforts to free her. He was a 'repealer,' but was more radical than O'Connell, and in 1845 seceded with the 'Young Irelanders.' He joined in the insurrection of Smith O'Brien in 1848, and after its failure fled to France, where he lived for some years in great poverty. In 1852 he went to New York, and there in 1858 was a member of the committee that sent a delegate to James Stephens in Dublin with proposals for the founding of the secret society later known as the Fenian Brotherhood. O'Mahony was one of the most active and influential promoters of the organization, and was for a time its president. In his later years he had a hard struggle to secure the bare means for subsistence. He died in New York in 1877, and his body was taken back to Ireland and buried in Glasnevin Cemetery, near Dublin, with great honors. In 1857 he published *The History of Ireland by Geoffrey Keating, D.D., Translated from the Gaelic and Copiously Annotated*. Consult Webb, *Irish Biography* (Dublin, 1888), and articles in the *Celtic Magazine* (New York).

OMALIUS D'HALLOY, ô-mă'lê-us' dă'lwa', JEAN BAPTISTE JULIEN, Baron d' (1783-1875). A Belgian administrator and geologist, born at Liège. He was appointed successively sub-intendant of the Arrondissement of Dinant (1814), general secretary of the Province of Liège (1815), and Governor of the Province of Namur (1815), and in 1848 was elected to the Senate. Geology was his avocation, and in recognition of his scientific work he was elected in 1816 a member of the Academy of Brussels, and in 1842 a corresponding member of the Academy of Sciences at Paris. In addition to many contributions to the bulletins of the Academy of Brussels and to technical journals, he published a *Description géologique des Pays-Bas* (1828); *Éléments de géologie* (1831; 3d ed. 1839); *Introduction à la géologie* (1833); *Coup d'œil sur la géologie de la Belgique* (1842); and other volumes.

O'MALLEY, CHARLES. The hero of Charles Lever's novel of the same name. The original of the character was an officer in an Irish regiment, Francis G. Keogh, who came to America after the appearance of the book, and is buried in Toronto, Canada.

O'MALLEY, GRACE. An Irish chieftainess. See GRAINNE NI-MHAILLE.

O'MALLEY, THADEUS (1796-1877). An Irish Roman Catholic priest and political writer, born at Garryowen, near Limerick. After his ordina-

tion in 1819 he went to America. In 1827 he was suspended on account of his ecclesiastical views, and returned to Dublin to be assistant priest of the cathedral. The first object of his pamphleteering was to obtain a poor law for Ireland, the second to improve the national school system, of which he published his opinion in *A Sketch of the State of Popular Education in Holland, Prussia, Belgium, and France* (2d ed. 1840). Founder of the *Social Economist* (1845), he used a later newspaper which he started, called the *Federalist*, for the advocacy of his views, which differed from O'Connell's in their disapproval of complete severance from England and belief that recourse to arms was necessary to accomplish the ideal federal union. O'Malley tried unsuccessfully to unite O'Connell's Old Ireland Party with his own Young Irelanders, and after 1870 he was a conspicuous home rule advocate, but, though orthodox in faith, was frequently rebuked by his superiors in the Church for the freedom with which he criticised their discipline in such works as his *Harmony in Religion* (1870). His last book was *Home Rule on the Basis of Federation* (1873).

OMAN, ô-măn'. An independent sultanate occupying the southeastern end of the peninsula of Arabia. It reaches along the Persian Gulf, the Gulf of Oman, and the Arabian Sea from El Hasa to the Hadramaut region (Map: Asia, E 6). The area is about 80,000 square miles. The boundaries in the interior are very indefinite, the authority of the ruler of Oman being recognized only over a small portion of the territory nominally embraced in the sultanate. The region along the coast is very mountainous, rising in its highest peaks probably to about 10,000 feet. Behind the mountain chains the country gradually passes into the great desert of Arabia. The most favorable part of the country is in the central valleys, which are characterized by a temperate climate and rich vegetation. The chief products are dates, which constitute the main article of export, and other fruits. Pearls and mother-of-pearl and fish are also of some commercial importance. The chief port is Muscat (q.v.). The exports and imports of Oman amounted in 1900-01 to \$1,359,893 and \$3,365,883, respectively. The imports consist of rice, cotton goods, coffee, sugar, silk, arms, ammunition, etc.

The population is estimated at 1,500,000, and consists of several tribes of Arab origin, partly nomadic. The negro element is very numerous. At present Oman is practically under the protection of Great Britain. A British resident is stationed at Muscat, the capital.

HISTORY. Muscat was taken by the Portuguese in 1508 and remained in their hands until the middle of the seventeenth century, when the Arabs of the interior secured possession of it. The imams or sultans of Muscat afterwards made extensive conquests in Eastern Africa, including Zanzibar, Mombasa, and Quiloa. Oman was at the climax of its power and commercial prosperity in the first half of the nineteenth century, when the authority of the imams or sultans of Muscat extended over the Persian territories of Laristan and Mogistan, the islands of Kishm, Bahrein, and Ormuz, the important town of Bender Abbas, part of the coast of Baluchistan, and a long strip of African coastland, including Zanzibar, Mombasa, and Quiloa, together with the

island of Socotra. The present ruling family originated in Yemen and was first established in the imamate in the person of Ahmed ibn Said in 1741. The rise of the Wahabi power in Nedjed (see ARABIA) resulted in considerable loss of territory. In 1856, on the death of Sultan Said, his possessions were divided between his two sons, one receiving the African territories and the other Muscat with the Persian possessions. These last were lost in 1875. Sultan Thuwani, who succeeded in Muscat, was assassinated in 1866 by his son Selim, who reigned but a short time, and was driven out by his uncle, Seyyid Turki ibn Said. In 1888 the latter was succeeded by his son, Seyyid Feisal ibn Turki. The relations of Oman with Great Britain have been most friendly. The power of the Sultan is exercised very little beyond the capital, Muscat, the name of which is therefore probably better known in popular usage than that of the whole State. Consult Sahib-ibn-Razik, *History of the Imams and Seyids of Oman*, from the Arabic by Badger (London, 1781).

OMAN, CHARLES WILLIAM CHADWICK (1860—). A British historian, born at Mozufferpore, India. He was educated at Winchester and at New College, Oxford, in 1883 became a fellow of All Souls' College, Oxford, and in 1900 deputy professor of modern history in the university. Among his published works are: *A History of Greece* (1888); *A Short History of the Byzantine Empire* (1892); *A History of Europe 476-918* (1893), in the "Periods of European History Series"; *A Short History of England* (1895); *A History of the Art of War in the Middle Ages* (1898); and *Seven Roman Statesmen* (1902).

OMAR (Ar. 'Umar ibn al-Khaṭṭāb). The second Mohammedan Caliph. He was born about 581. Before the year 617 he opposed the Prophet, but in that year he was won over to the new faith and became one of its ablest supporters. He was associated with Abu-bekr as one of his principal advisers, and on the death of Abu-bekr in 634 succeeded as Caliph, and pushed on the wars of conquest which had been undertaken by his advice, with increased vigor. The beginning of his reign was signalized by the victory of Cadesia (635) over the Persians. By 637 Omar had completed the conquest of Syria and Palestine. In 639 he sent Amru to invade Egypt. In 641 Alexandria fell, and the country passed from the Greeks to the Saracens. He was summoned to Jerusalem in 637 to receive the keys of that city. Barca and Tripoli were next subdued by Amru. Armenia was overrun in 641, and about the same time the victory of Nehavend brought Persia under the sway of the Arabs. In 644 Omar was assassinated in the mosque of Medina by a Persian slave from motives of revenge. He lingered five days after receiving the wound, but refused to appoint a successor, and named six commissioners who were to choose one from among themselves. He was buried in the mosque of Medina, near the Prophet and Abu-bekr, and his tomb is still visited by pilgrims. Omar may be called the organizer of the Mohammedan power, as from a mere sect he raised the followers of Islam to the rank of a conquering nation, and left to his successor an empire. He was the founder of many excellent institutions; he assigned a regular pay to his soldiers, and made

some excellent regulations for the more lenient treatment of slaves. He originated the practice of dating from the era of the Hejira (q.v.). See references under CALIPHS and MOHAMMEDANISM.

OMAR, MOSQUE OF. A structure on the site of the ancient temple on Mount Moriah at Jerusalem (q.v. for illustration), said to have been built by the Caliph Omar. It is octagonal and constructed of colored marbles and tiles. It contains the 'Sacred Rock,' formerly looked upon by the Jews as the site of the intended sacrifice of Isaac and of the altar on which the sacrifices of the temple were offered. In Mohammedan belief, the rock was the scene of the Prophet's ascension to heaven and bears the imprint of his feet.

OMAR KHAYYAM, ō'mär kt-yām' (?-?1123). A Persian poet and astronomer. He was a native of the city of Nishapur in Khorasaan. The date of his birth is not known, but it was probably before the middle of the eleventh century. His full name is given as Ghiyath ad-Din Abul-Fath Umar ibn Ibrahim-al-Khayyami. The name Khayyam, 'tent-maker,' seems to have been derived from his father's occupation.

There are a few general points known about his life. He had a good education for his time, and the excellence of his memory is proved by a report that he could recite by heart, without a mistake, a book when he had read it over seven times. His special training was acquired from an aged teacher of Nishapur, the Imam Muaffak. There is a persistent tradition that two of Omar Khayyam's fellow-students were Nizam ul-Mulk and Hassan ben Sabbah; the former of these was destined to become famous as the Grand Vizier of Alp Arslan, the latter infamous as the founder of the order of 'Assassins.' There are chronological difficulties in the way of making these three persons contemporaries in their youth, and this has led generally to a rejection of the story. The tale runs thus: The three collegians entered into a compact that whichever should first attain to fortune should aid the other two likewise to success. Nizam ul-Mulk's talents and skill elevated him to the position of Grand Vizier to Alp Arslan. Not forgetful of the pledge, he raised Hassan to a position at Court which the latter soon abused. On Omar Khayyam, apparently by Omar's own preference, Nizam ul-Mulk arranged to bestow an annual stipend of 1200 *mithkals*, or about \$3000 a year, to enable him to follow his chosen pursuits. On the death of Alp Arslan and the accession of Jalal ad-Din Malik Shah, Omar Khayyam repaired from Nishapur to the new Sultan's capital, which was then at Merv, and received the appointment of Astronomer-Royal to the Court. He was engaged with seven other scientists to reform the calendar, which resulted in the adoption of a new era, the Jalalian, or in Persian *Tarikh-i-Jalal*, or *Malik-Shah*. This mode of reckoning dated from March 15, 1079 (tenth Ramazan, A.H. 471). His work on this commission was doubtless in large part only through collaboration, but the results of it are embodied in a series of astronomical tables known as *Zij-i Malik-Shah*. Besides this work three other mathematical contributions bear Omar Khayyam's name: an unedited monograph on extracting the square and cube roots, and another on 'Some Difficulties of Euclid's Definitions,' while his Algebra, translated by Wepke in 1851, was important in the history of mathe-

matics. It was as an algebraist that Omar made his most noteworthy contribution to science. In this respect, he stands out as the most notable mathematician of his time. He was the first to attempt a systematic classification of types of equations of the first three degrees, and to consider cubics from the standpoint of the general equation, rather than as means for solving specific geometric problems. While he could solve certain cubics, he was not able to find a general solution. Biquadratics he asserted to be insoluble by geometry, the method always thought necessary for the cubic until after his time. He also knew the rule for expanding a binomial for positive integral powers, a rule afterwards perfected by Newton as the binomial theorem (q.v.).

In still other scientific lines Omar Khayyam's intellectual activity found expression; he composed three different books on subjects of natural science, and three likewise on metaphysics. But it is on his verses as the author of the *Rubā'iyāt*, or quatrains, that his name will live.

The first Occidental mention of the *Rubā'iyāt*, or renowned collection of quatrains, is found in Hyde, *Historia Religionis Veterum Persarum*, pp. 498-500 (Oxford, 1700); but neither this allusion nor notices by Sir Gore Ouseley and others attracted any special attention. It remained for Edward FitzGerald (q.v.) to introduce Omar to the West through a version of a hundred of the quatrains. The version is indeed a paraphrase, yet often very close, and it has caught almost exactly the spirit of the original. FitzGerald boldly ventured to rearrange the hundred stanzas that he chose so as to give in a sort of sequence the development of the poet's changing moods. There is no standard manuscript to serve as a norm, and in the manuscript the quatrains are simply arranged in the alphabetic order of the final letter of the rhyme without reference to content. It is not even actually known how many of the quatrains are really Omar's. Over five hundred of these four-line stanzas are found, in different works and manuscripts, ascribed to him. Their tone is varied. In some the note is that of revolt against the Divine Master, whose power the slave must nevertheless acknowledge. A number of the quatrains revile the Sufis, yet after all Omar had been trained under Sufi influence, and so may not be wholly free from the mystic tinge. A strain of pantheism runs through many quatrains; while the song of the nightingale, its devotion to the pallid rose whose cheek the spring-time causes to blush; the pleasures of love; and the joy of the fleeting hour darkened by the knowledge of inevitable death, give a tenderness to others that is truly poetic. The tone of much of Omar's verse was justly regarded as heretical by orthodox Mohammedan Persia; it is often debatable in the West whether the wine and the wine cup be symbolic or Anacreontic. Perhaps the latter is nearer the truth, although some allowance will be made by those who are acquainted with the mystic poetry of Hafiz, Jami, Nizami, or Jalal ad-Din Rumi.

The date of Omar Khayyam's death is not certain. The year is given as A.D. 1111 (A.H. 505) or as A.D. 1123 (A.H. 517); the latter, however, is much more probable. The story goes that he had prophesied that his grave would be at a place where a fruit tree should shower blossoms

upon it; and this has been fulfilled, for his tomb at Nishapur is in the midst of a garden of roses, sheltered by fruit trees and bays.

BIBLIOGRAPHY. The Algebra of Omar Khayyam was edited and translated by Wœpke, *L'algebre d'Omar Alkhayyâm* (Paris, 1851). An almost complete bibliography of manuscripts, editions, translations, and imitations of the Quatrains is given by Dole, *Rubaiyat of Omar Khayyam* (Boston, 1896). FitzGerald's rendering into English verse has been constantly reproduced since the first edition at London in 1859. More important from a scholarly point of view are the edition of five hundred quatrains with a metrical text translation, by Whinfield (2d ed., London, 1893), and the elaborate translation, keeping the metrical tricks of the original, by Payne, *The Quatrains of Omar Khayyam, Now First Completely Done into English Verse from the Persian, with a Biographical and Critical Introduction* (ib., 1898); and Heron-Allen, *The Rubaiyat of Omar Khayyam: A Facsimile of the Manuscript in the Bodleian Library, Translated and Edited* (Boston, 1898). The convenient reissue of FitzGerald with a commentary by Batson, and a biographical introduction by Ross, *The Rubaiyat of Omar Khayyam* (New York, 1900), is also of considerable interest. The mysticism of Omar's poetry is ably treated by Bjerregaard, *Sufi Interpretations of the Quatrains of Omar Khayyam and FitzGerald* (ib., 1902).

OMAR PASHA, ō'mār pā-shā'. A Turkish general. See **OMER PASHA**.

OMBAY, ōm-bā'. One of the smaller of the Sunda Islands, situated near the eastern end of the group, 40 miles north of Timor and 260 miles southeast of Celebes (Map: Australasia, E 3). Area, 892 square miles. It is mountainous and volcanic, and inhabited almost exclusively by savage tribes of a mixed Malay and Papuan race. At Allor, on the northwest coast, is a Dutch settlement with some trade in wax, pepper, and edible birds' nests.

OMBOS (Gk. Ὀμβοι, *Omboi*). An ancient Egyptian town on the eastern bank of the Nile in latitude 24° 28' N., about ten miles south of the Jebel Silsileh. The site, which has long been uninhabited, bears the modern Arabic name of Kôm Ombô, 'the hill of Ombo.' The top of the hill forms a broad plateau upon which are the ruins of the town and of its fine temple buildings. In spite of its excellent strategic position upon an elevation commanding both the river and the route to Nubia, Ombos seems to have been a town of no special importance in the earlier period of Egyptian history. Under the Ptolemies, however, it advanced rapidly, was made the capital of the newly formed nome of Ombites, and continued to flourish down to a late period under the Roman Empire. The temple buildings, which date from the Ptolemaic period, formerly stood within an inclosure surrounded by a brick wall. Traces of this wall and a portion of the pylon forming the entrance to the inclosure yet remain. The court of the great temple, dedicated to the crocodile god Sobk and to Haroeris, was formerly colonnaded on three sides, and, at its upper end, several doors give entrance to a hypostyle hall opening by two doors into a smaller hall, from which three successive antechambers lead to the two sanctuaries. The latter are placed side by side, that of Sobk on the right and that

of Haroeris on the left. Adjoining the ante-chambers and sanctuaries are a number of smaller chambers and corridors. A long corridor, starting from the upper end of the hypostyle hall, surrounds the inner portion of the temple, and outside of this a similar corridor runs parallel to it between the outer and the inner walls of the edifice. The reliefs adorning the walls and columns of the temple are inscribed with the names of Ptolemaic kings and Roman emperors. In front of the great temple stands the ruined birth-house built by Ptolemy Euergetes II.; to the right is a small temple dedicated to the goddess Hathor by the Emperor Domitian. Consult: *Description de l'Égypte* (Paris, 1820-30); Dümichen, *Geschichte des alten Aegyptens* (Berlin, 1878); Mariette, *Monuments of Upper Egypt* (London, 1877); De Morgan, *Kom Ombo* (Vienna, 1894).

OMDURMAN, ǝm-dǝǝr'mán. The former capital of the successor of the Mahdi, situated on the left bank of the White Nile opposite Khartum (q.v.) (Map: Africa, H 3). It extends for a long distance along the river, and is believed to contain a population of 60,000. Omdurman is noted as the place where the Dervishes were overwhelmed by the Anglo-Egyptian troops under Lord Kitchener on September 2, 1898.

O'MEARA, ǝ-má'rà, BARRY EDWARD (1786-1836). An Irish surgeon, notable from his connection with Napoleon I., whom he accompanied to Saint Helena as household physician. At the age of eighteen he entered the British Army as assistant surgeon, afterwards transferring to the navy. He was serving with Captain Maitland in the *Bellerophon* when the Emperor Napoleon surrendered to that officer. He was introduced to Napoleon, on whom the impression he produced was favorable, leading to a proposal that he should accompany the Emperor into exile as private physician, an arrangement to which he acceded, stipulating that he should retain his rank in the navy, and be permitted to return to it at pleasure. Of his conversations with Napoleon, during a period of about three years, O'Meara took notes, which he afterwards published. Meantime he became involved, in the interest of Napoleon, in the series of squabbles which he waged with the Governor, Sir Hudson Lowe (q.v.). In 1818, after a violent altercation with Sir Hudson, O'Meara was committed to close arrest, and was authorized by the Emperor to resign his post. On his return to England he addressed a letter to the Admiralty, in which, among other things, he accused Sir Hudson Lowe of intentions against the life of his captive, and even of having, by hints, insinuated a desire for his services as secret assassin. For this he was instantly dismissed the service. After Napoleon's death O'Meara published *Napoleon in Exile* (1822) by which book alone he is now remembered.

OMENS (Lat. *omen*, OLat. *osmen*, prognostic, from *os*, mouth; connected with *auris*, Gk. *ōs*, *ous*, Lith. *ausir*, OChurch Slav. *ucho*, Goth. *ausō*, Ger. *Oh*, AS. *ēare*, Eng. *ear*). Events supposed to presage a future event. From prehistoric time it has been a universal belief that any important occurrence is preceded by omens, or, to use the traditional English word, by 'signs,' which will allow any observer to forecast what is to be. The notion may be regarded as an an-

ticipation of modern science, but in the absence of adequate knowledge, attempts at prediction were of necessity fantastic, and any phenomenon was supposed to indicate good or evil, according to the effect which it produced on the imagination. Hence arose a mass of popular rules, handed down from generation to generation, and which exhibit all over the world great similarity. The signs noted in Anglo-American folk-lore are as old as any, and in part date back to a period antedating civilization. Among these omens a great number relate to the principal events of life, birth, marriage, and death. The last, especially, as the chief object of anxiety, has occupied a share of attention sufficiently proved by the bad sense attached to the terms fatal and ominous, while a multitude of occurrences, frequently of an insignificant character, are popularly held to betoken the speedy ending of life. Thus, it is said in popular lore that a death will occur if a batch of bread, in baking, cracks across the top, if the flame of a candle exhibits the excrescence called a 'winding-sheet,' if a person carries through the house a hoe or spade, or if a rose or other plant blossoms in the fall. Again, if during a funeral any one passes between the carriages, or if the procession returns by the same road as that which conducted it to the cemetery, another death will occur. In undertaking a journey, good or ill luck is conjectured from the animals encountered on the path. If a rabbit or (in other localities) a squirrel cross the track, the expedition will be fortunate if the creature pass from left to right, the reverse if from right to left; in the latter case, the misfortune can be averted by making a cross-mark with the feet. The passage of a cat, especially a black cat, is bad luck, unless the traveler immediately turns. So omens are taken from the flight of birds. If, as one leaves his house, a crow flies in front, it is said to be an evil portent, while the sight of a redbird is held to be a token of lovers' meeting. Hearing the cry of a whippoorwill when about to start on a journey indicates danger. Such beliefs are entirely in the spirit of ancient augury, according to which especial attention ought to be paid to the position and the notes of birds which may be met on the way. Other omens are taken from insects and plants. Thus, the color of the first butterfly seen in the spring is said to show the color of the first new dress, the chirping of a cricket to foretell sorrow, the advent of a bumblebee into the house to be a sign of news or company. Marks about the person of babes are supposed to be significant of character. Thus in English nursery lore, a straight line on the palm is regarded as a token of early death, while white and blue spots on the nails are taken to denote good or evil fortune. From such notions, originally of a simple nature, came to be developed an elaborate science of palmistry. When systems of rules had once been established, and connected with life, they continued with great obstinacy, so that the perception of failure in the validity of such expectations was met, not by discrediting the theory, but by increasing the complication of the maxims. A large mass of popular sayings relate to the determination of the weather, supposed to be predictable by means of signs often of a nature highly fantastic. The weather in each of the twelve days after Christmas is said to indicate that to be expected for

every month in the year. Omens are derived from the actions of animals; if the winter is to be severe, they lay up additional supplies, or are more careful in constructing their habitations. The collection and classification of omens belonging to all countries has not yet proceeded far enough to determine how far they agree in different regions.

OMENTUM. See **PERITONEUM**.

OMER PASHA. ô'mër pa-shâ' (1806-71). A celebrated Turkish general, born of Christian parents at Plasky, an Austrian village in the former Croatian Military Frontier. Michael Lattas (this was his real name) was educated at a military school, and joined a frontier regiment, but fled in 1828 to Bosnia, turned Mohammedan, and became tutor in the household of Hussein Pasha, Governor of Widdin. In 1834 he was made writing master in a military school at Constantinople, and instructor to Abd-ul-Medjid, heir apparent to the throne. Omer was made Governor of Lebanon in 1842, and successively repressed insurrections in Albania, Kurdistan, and Bosnia. In 1853 he defeated the Russians at Oltenitza, and in 1854 at Silistria, gaining possession of Bucharest. Later he repulsed the Russians at Eupatoria, in the Crimea, and set out to relieve Kars, but failed. He became Governor of Bagdad in 1857, but was dismissed in 1859 on account of maladministration. In 1862 he repressed the insurrection in Montenegro and took Cetinje. In 1864 he was made field-marshal, and in 1867 was sent to put down the rebellion in Crete. From 1869 he was Minister of War. As a commander Omer was noted especially for his excellent strategy.

OM MANI PADME HUM, ôm mǎ'né pad'mé hōôm. A sacred formula in Buddhism, the so-called formula of six syllables, well known from the part which it plays in the Buddhist religion, and especially in that form of it called Lamaism. The reputed author of this formula is the Dhyana-Bodhisattva, or deified saint, Avalokitesvara, or, as the Tibetans call him, Padmapani, the lotus-handed, or Amitabha. He is the Buddha of Eternal Light, the heavenly ruler of the Western paradise. Like Buddha, he is represented as sitting or standing within a lotus, and apparently there is an allusion to this in the sacred formula itself, *Om mani padme hum*, 'O, the Jewel in the Lotus, Amen!' The sacredness of this formula is sufficient when recited to secure exemption from the cycle of reincarnation, and final rebirth in the celestial paradise over which Amitabha rules. It would appear not to belong to the earliest stage of Buddhism, or to the oldest Buddhist works of the north of India, or to those of Ceylon. Consult: Bur-nouf, *Introduction à l'histoire du Bouddhisme indien* (Paris, 1844); Koepen, *Die Religion des Buddha* (Berlin, 1857-59); Schlagintweit, *Buddhism in Thibet* (Leipzig, 1863); Waddell, *The Buddhism of Tibet, or Lamaism* (London, 1895).

OMMIADS, ôm-mi'adz, **OMAYYADS,** or **OMMEYADES.** A dynasty deriving its name from an ancestor, Omayya (Arabic *Umayyah*), which succeeded to the Arabian caliphate on the death of Ali, the fourth Caliph (661), and possessed it till superseded by the Abbassides (q.v.) in 750. Moawiyah (q.v.), the founder of the dynasty, was the son of the Koreish leader Abu-Sofian, who defeated Mohammed at Bedr,

and his mother was the notorious Hinda. After the death of Othman, the third Caliph (656), Moawiyah, who was his cousin, claimed the throne, and during the whole of Ali's reign ruled over the western provinces of Syria and Egypt; but it was not till the death of that Caliph, and the abdication of his son Hassan, that Moawiyah's authority as Caliph was recognized (661). He transferred the seat of the caliphate to Damascus, Kufa having been the residence of Ali, and Medina of the first three caliphs. The Arabs continued to extend their conquests during his reign; the Turks in Khorasan were subdued, Turkestan was invaded, and several important acquisitions were made in Asia Minor. The Caliph neglected no means of consolidating the Empire, and partly for this reason he made the succession hereditary, and caused his son YEZID (680-83) to be recognized as his heir. The reigns of Yezid and his successors, MOAWIYAH II. (683) and MERWAN I. (683-685), are devoid of importance, as their sway extended only over Syria and Palestine. ABD-EL MELEK (685-705), an able and warlike prince, succeeded in rendering himself undisputed ruler of the Mohammedan world (692), but the latter part of his reign was much disturbed by rebellions in the eastern provinces. He was the first Caliph who interested himself in the promotion of liberal knowledge, causing the most celebrated poetical and other works of the Persians to be translated into Arabic. Four of his sons, WALID I. (705-716), SULAIMAN (716-717), YEZID II. (720-724), and HISHAM (724-743), successively occupied the throne. Under Walid, the Ommiad caliphate reached the summit of its power and grandeur; Northern Africa (709), Spain (711-714), Turkestan (707), and Galatia (710) were conquered; while toward the close of his reign his empire was extended even to the Indus. OMAR II. (717-720), who, in the justice and mildness of his government, surpassed the whole of the race of Omayya, was appointed to succeed Sulaiman; but having excited discontent among his relatives by suppressing the formula of malediction against Ali and his descendants, which had hitherto been regularly pronounced at all public ceremonies, he was poisoned. The invasion of the country of the Franks and a siege of Constantinople in his reign marked the limits of the Ommiad power. Hisham, though, like his immediate predecessor, fond of pleasure, possessed all the qualities necessary for a sovereign. The Greeks, who still strove for the possession of Asia Minor, were repeatedly defeated; the Turks of Northern Persia and Turkestan were kept in stern subjection, and the civil affairs of the Empire carefully and strictly administered. Nevertheless the power of the dynasty now began to decline. The march of conquest in the West was arrested by Charles Martel (q.v.) at Poitiers (732), the discontented descendants of Ali raised the standard of revolt, and Ibrahim, the fourth in direct descent from Abbas, the uncle of Mohammed, invested Abu-Moslem with the arduous duty of enforcing his long-agitated claims to the throne. The reigns of WALID II. (742-743), YEZID III. (743-744), and IBRAHIM (744), though of ephemeral duration, were long enough to produce a complete disorganization of the Empire; and though Ibrahim's successor, MERWAN II. (744-750), was both an able and politic ruler, and a skillful warrior, the declining fortune of his family was beyond remedy.

Abu-Moslem, who had proclaimed the claims of the Abbassides amid the ruins of Merv in 747, took the field at the head of a small but zealous band, and carried the black flag of the Abbassides from victory to victory, till before the close of the following year the whole of Khorasan acknowledged his authority. Irak was subdued in 749; and though Ibrahim, the Abbasside claimant, was seized by Merwan, and executed in the same year, his brother, Abul-Abbas, succeeded to his claims, and the unfortunate Caliph, defeated in two engagements, fled to Egypt (750), whither he was pursued and slain. Abdallah, the uncle of the successful claimant, treacherously invited the remaining members of the House of Omayya to a conference, and ordered a general massacre of them. Two only escaped: the one to the south-east of Arabia, where he was recognized as Caliph, and where his descendants reigned till the sixteenth century; the other, Abderrahman, to Spain, where he founded the Emirate or Kingdom (afterwards Caliphate) of Cordova in 756.

OMMIADS OF SPAIN. ABDERRAHMAN I. (756-787) accepted the Spanish throne, which was offered him by the Arab chiefs of the West. In spite of numerous revolts, he strengthened and extended his power in Spain, till, with the exception of Asturias and the country north of the Ebro, his authority was everywhere acknowledged. He divided his kingdom into six provinces, whose rulers, with the *walis* of the twelve principal towns, formed a sort of national diet. His successors, HISHAM I. (787-796) and AL-HAKEM I. (796-821), were troubled with internal revolts, under cover of which the Christians established in the northwest what was known as the 'Spanish March.' ABDERRAHMAN II. (821-852) reestablished internal quiet, and occupied his subjects with incessant wars against the Christians. These conflicts developed among the Arabs that chivalrous heroism which is found nowhere else in the Mohammedan world. Abderrahman II., himself a man of learning, greatly encouraged the arts and sciences, and diffused information among his people; he also attempted, by regulating the laws of succession to property, to constitute his kingdom on a basis similar to that of other European nations. During his reign Mohammedan Spain was the best governed country in Europe. His successors, MOHAMMED I. (852-880), MONAYYIR (880-882), and ABDALLAH (882-912), followed in his footsteps. ABDERRAHMAN III. (912-961), who assumed the title of Caliph, in opposition to the Abbasside caliphs of Bagdad, after suppressing some dangerous revolts which had gathered head during his minority, conquered the Kingdom of Fez from the Edrisites, and brought a long and exhausting war with the powers of Asturias and León to a victorious conclusion. This period is justly termed the golden age of the Arab domination in Spain, for at no period was their power so consolidated, and their prosperity so flourishing. (See CORDOVA.) Abderrahman III., like his predecessors, was a great patron of learning, and a poet of no mean ability. He founded schools which far surpassed those in other parts of Europe. His son, AL-HAKEM II. (961-976), was in every way worthy to be his successor. HISHAM II. (976-about 1009), a child of eight years, now occupied the throne; but fortunately his mother, Sobeiha, possessed the abilities necessary for such an emergency, and 'appointed as her son's vizier

Mohammed ibn Abdallah, surnamed Al-Mansur, who had originally been a peasant. His administration was equally just and judicious, and his encouragement of literature, science, and art alike liberal and discriminating. But it is as a warrior that he is chiefly remembered. The lost provinces were recovered; Castile, Leon, and Barcelona were conquered; and Navarre was on the point of sharing the same fate, when a rebellion in Fez compelled him to detach a portion of his forces for service in Africa, and the combined armies of the four Christian monarchies, seizing this opportunity, inflicted upon the Arabs a sanguinary defeat in 1001. Mohammed's spirit was completely broken by this blow, and he died a few days afterwards. With him the star of the House of Omayya set forever. The rest of Hisham's reign was a scene of disorder and civil war. Pretenders to the caliphate arose, while the *walis* of the various provinces set up as independent rulers, and the invasions of the Christians added to the confusion. With the expiration of the brief reign of HISHAM III. (1027-31), the family of Omayya disappears from history. The three centuries of Ommiad rule in Spain is the period which gives lustre to the name. Consult Dozy, *Histoire des Musulmans d'Espagne* (Leyden, 1861); Viordot, *Histoire des Arabes et des Maures d'Espagne* (Paris, 1851). See references under MOORS.

OMNIBUS BILL. A term frequently applied to single legislative acts in which are incorporated a number of loosely related or wholly disconnected measures. The term probably first applied to a bill proposed in Congress in 1850 for the admission of California to the Union with a Constitution prohibiting slavery; for the organization of New Mexico and Utah without reference to slavery; for the abolition of the slave trade in the District of Columbia; for the payment of \$10,000,000 to Texas for her claim to a part of New Mexico; and for the more efficient rendition of fugitive slaves. (See COMPROMISE MEASURES OF 1850.) As each of these matters was finally covered by a separate bill, it is incorrect to speak of the compromise measures of 1850 as the 'omnibus bill,' as is frequently done. A more recent instance of the kind was the Springer 'omnibus bill' of February, 1889, for the admission of Washington, Montana, and the Dakotas to the Union. Omnibus bills were formerly passed with some frequency, by State Legislatures, but in recent years provisions have found their way into a number of Constitutions requiring that single statutes shall deal with but one main subject, which shall be clearly indicated in the title. This has proved fatal to the 'omnibus bill' in most cases.

O'MORE, *Ó-móir*, ROGER, or RORY (?-1652). An Irish patriot. He was the principal conspirator with Sir Phelim O'Neill in the attempted seizure of Dublin Castle in 1641, and as colonel of Ulster troops won a victory at Julianstown Meath. He fought under Owen Roe and with Antrim in 1644, but after the failure of the 1650 uprising, in which he was engaged, he disappeared and is supposed to have died miserably.

O'MORE, RORY, or RUBY OGE (?-1578). An Irish patriot, second son and namesake of a captain of Leix. He entered young into the national conflict, and was pardoned in 1566-66. He was imprisoned for his share in the Kildare plots

of 1574. He escaped, and was pardoned again in 1576, but the hope of help from Spain made him rebel once more. After several escapes he was caught and killed by the Fitzpatricks, and his head was set up on Dublin Castle.

OMPHALE, *óm'fá-lě*. The Lydian queen whom Hercules served. See **HERCULES**.

OM'PHALUS (Lat., from Gk. *ὀμφαλός*, *omphalos*, navel, the centre point). The name of a stone in the Temple of Apollo at Delphi, supposed to mark the centre of the earth. According to the legend Zeus loosed two eagles, one at the east and one at the west, and in their flight they met at this point. In works of art the stone is conical, and covered with a network of fillets or ribbons, while often on either side are perched the eagles. In the time of Pausanias the Omphalus stood outside the temple. The origin of the Omphalus is not clear. Conical stones were elsewhere worshiped, but there is much in the Delphic legend which suggests that the Omphalus

marked a grave, and was connected with an early chthonic cult.

OMSK, *ómsk*. The capital of the Territory of Akmolinak and of the Governor-Generalship of the Steppes, Russian Asia, situated at the confluence of the Om with the Irtysh, on a barren steppe, 1624 miles by rail east of Moscow (Map: Asia, G 3). Its average annual temperature is somewhat over 33°. It is poorly built. It has two gymnasia, a seminary for teachers, a technical school, and the West Siberian section of the Russian Geographical Society. Its industries are unimportant. Its commerce has somewhat developed since the construction of the Trans-Siberian Railway, Omsk having become a distributing station for Western Siberia. Population, in 1897, 37,470.

OMUL, *ó-mul'*. A small salmon (*Salmo migratorius*), which abounds in Lake Baikal and other waters of Eastern Siberia, whence great quantities are sent salted to all of the western parts of the country.
